Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Correspondence: Im trying to figure out what the good is in restoring grizzly bears to the cascades in Washington. An apex predator roaming the mountains and hills with thousands of hikers does not sound like a good idea. Washington has substantially more hikers than montana and wyoming and we hear about deaths every year from grizzlies in those states. Putting grizzlies in our neck of the woods will only be putting people in danger and at risk especially with the limited game washington has. With this in mind i cant fathom a better excuse of why we need grizzlies in the cascades.

Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies

thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Correspondence:	Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed

species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies

thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Re: Extension Request for Scoping Period (Federal Register / Vol. 87, No. 218 / Monday, November 14, 2022 / Notices)

Ms. Shultz and Mr. LaValle,

On November 14th, 2022, the National Park Service (NPS) and United States Fish and Wildlife Service (USFWS) issued a Notice of Intent (NOI) to reinstate a formerly terminated Grizzly bear recovery plan necessitating the development of an Environmental Impact Statement (EIS) (Federal Register / Vol. 87, No. 218 / Monday, November 14, 2022 / Notices). The affected Farm Bureaus and Counties presumed that the termination of an extensive EIS process with associated substantive comment and documentation would preclude the responsible federal departments from reinstituting such a costly, unnecessary, and controversial proposal in the short term. With no preliminary notice from NPS or USFWS to Member County Farm Bureaus and County Governments DOI issued this notice of intent providing only a 30-day scoping period which is significantly limited by fall meetings, end of year planning, and Thanksgiving and Christmas. Further no face to face in person meeting were scheduled for the scoping period. Virtual meetings fall short of providing the people of Washington ample opportunity to meaningfully engage in this matter.

To ensure meaningful participation in this process we formally request the NPS and USFWS to hold in-person public hearings in, at a minimum, each directly affected county within the NCE footprint.

We also request at the least a 30-45-day extension on the public scoping period so that the Member Farm Bureaus and Counties have sufficient time to analyze priorities and develop substantive comment for the scoping process.

Extending the scoping period is critical as the DOIs announcement for this proposal coincides with fall meetings and national holidays.

Given the significance of this proposal to the people of Washington, lessees of state and federal lands, and the presence of prime farmlands in the region of influence, an extension of the scoping period and public comment opportunity will ensure robust, thorough, and necessary public participation occurs.

The people of Washington most effected by this proposal spend their time in the field, far from a computer, and in many instances, far from reliable internet service. Rural resource dependent counties have long been underserved by federal departments in their rule-making procedures and regulatory actions, ceding the rule making influence to special interest environmental organizations who have the time and resources to drive these processes. We ask the NPS and USFWS to recognize these compounding factors and take action to facilitate comment and public participation in a comprehensive and meaningful manner. As this process proceeds it is critical that NPS and USFWS officials come out from behind their computers and meet in person, face-to-face with the people of Washington.

We request your prompt consideration and approval of this request. If you or your staff have any further questions, please contact me.

Respectfully yours,

Dick Ewing

Dick Ewing

President

Okanogan County Farm Bureau

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence:	Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

Correspondence: As a lifetime Seattle resident, I believe we should do everything we can to preserve our state. I am concerned about how many species of animals are disappearing due to climate change. Since there were abundant grizzlies in the North Cascades in the distant past, we should bring them back. They can be essential to the North Cascades ecosystem. We need to keep Washington wild in areas where we can! Thank you!

Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies

thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for your service. I have family that live in Lake Chelan right on the edge of the North Cascades ecosystem as drawn in the documents provided, and that area is a beautiful landscape. I strongly support the proposal by NPS and FWS (the "Service") to reintroduce grizzly bears into the North Cascades ecosystem. Grizzly bears were previously much more widespread in the lower 48 states, and now they are functionally limited to a much smaller range in Wyoming, Montana, and Idaho (in addition to Canada and Alaska). Reintroducing them in the North Cascades would help recover and improve the ecosystem and create a second population center in the lower 48, taking some of the pressure off of the populations in the Northern Rockies. I believe the Service should work with local ranchers and landowners on management of grizzly bears, to provide education on non-lethal deterrence techniques to protect livestock, and otherwise mitigate human-wildlife conflict, and help provide education to hikers and recreating tourists on bear safety knowledge. However, I am very happy that the Service is proposing to reintroduce grizzly bears to this beautiful ecosystem where they belong. Grizzly bears have a right to be restored to the landscape. Thank you again for your service and for the opportunity to provide comment.

Correspondence:	Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies

thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Correspondence: If grizzlies are introduced into North Cascades National Park, I think it is inevitable that there will be interactions between bears and human park visitors, nearby farmers and ranchers, and perhaps other people. Some of those interactions will result in injury and possibly death to the humans.

I recognize that many precautions are being taken and much education is being disseminated to minimize these occurrences, but I am sure some will take place anyway.

In other locations, after a bear/human interaction, it is common for government people to go out and kill the bear, which is a second loss resulting from the incident.

I believe that the likelihood of human/grizzly interactions requires a public discussion and, eventually, a public policy decision as to whether it is acceptable that reintroducing grizzlies into the Park's ecosystem is worth the sacrifice a few people and a few bears.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: NO to the reintroduction of grizzlies. Actually there is no "reintroduction". Several thorough studies have been held regarding grizzlies in the Cascades since at least the 1970's. No proof was ever found of grizzlies residing in the Cascades. However, a rare grizzly has been found to wander over from the Canadian side. I have had property near the Pasayten Wilderness for over 30 years. There is not much habitat in the Wilderness to sustain them, so they tend to return to the Canadian side. We are tired of the feds and city-dwellers telling us how to live and who shall reside near us. Stop this action to install grizzlies at once.

Correspondence: No, I do not want grizzly bears brought in to washington state. If they come in on their own will, that's okay. But the rate of 30 breeding pairs a year dropped into our forests, is too much. It will be just like reintroducing wolves, only worse! Tax dollars will be used to thin them out when they cause problems?? They are very large and formidable animals...what about hikers on the PCT?? What about the native black bears? If people want to see them , they can visit Yellowstone or Alaska..

Correspondence: I support alternative B in the EIS, which is to reintroduce grizzly bears to the North Cascades under the experimental population designation of ESA. Grizzly bears are an important missing component of the North Cascades ecosystem; bringing them back will make this system one of the few in the lower 48 that has a complete predator guild, now that wolves have returned and fishers have been reintroduced. Grizzlies have lower rates of livestock depredation than do wolves, coyotes, and cougars, and attacks on people are very rare. Listing their population as "experimental" allows for individuals to be lethally removed if they do threaten people or livestock. Ideally, grizzlies would recolonize this ecosystem on their own. But studies have shown this is unlikely to occur due to major dispersal barriers. Thus, I support a more active approach to recovering grizzlies in the North Cascades. Although there is the potential for conflict with humans, I believe the benefits of their presence in this large wilderness area far outweigh the costs.

Correspondence: Respectfully this is a bad idea. First, if repopulation is needed, and no credible data apart from the desire to reduce deer/elk as a means of reducing citizens' exercise of 2nd Amendment rights, then start in Canada and see how that works over 25 years. All the data in support seems skewed to gain more federal and state funding, increasing pension personnel who otherwise would be assisting Washington enforce existing policies, helping manage existing wildlife that are actually threatened. These agencies can't manage salamanders and salmon despite decades of data, and supporting law. Second, if repopulation is needed, then when the first child is mauled or killed camping or hiking, or just playing in their backyard, have Paula MacKay and Robert Long pay all the costs and explain the necessity to the surviving family in person. This is a gimmick program. Third, who will pay the costs of harm or will everyone involved with reintroduction have immunity and without accountability. If it's such a solid idea, backed by empirical evidence then each officer, agent and employee involved should bear the costs of any and all harm or injury caused, not individual taxpayers or citizens. Fourth, when a motorcycle, electric car or commercial vehicle traveling I-5 at 75 mph or state highways and hits a 800lb grizzly what processes are in place? Last, since an adult male grizzly needs a large range (50-150 sq miles and travel up to 800 miles), when they start killing in Renton, Issaquah and Sammish watch how the fight shifts and it will... too late.

Correspondence: I am very excited that Grizzly Bears might be introduced to the North Cascades, as they would enhance the ecosystem tremendously. We definitely should work to repair some of the harm we have done to the ecosystem when we removed grizzlies from the North Cascades. We need these keystone species omnivores. Please please reintroduce them & they are native and very much belong here in the Pacific Northwest

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Grizzly Bears will be attracted to Okanogan counties fruit bearing trees which support an abundant agricultural economy. This will be dangerous working conditions for pickers which would discourage employment and add very expensive protection measures such as electric fencing or lighting. Are you considering the legal recourse available to agricultural businesses and their employees should dangerous situations arise? Have you anticipated the mitigation costs involved? Will Grizzlies be fitted with tracking devices to warn of potential confrontations at orchards?

Correspondence: I strongly support and applaud this proposed action.

Grizzlies are necessary apex predators that would benefit the ecological health of the North Cascades.

Alternatives should evaluate different reintroduction options and how any human conflicts would be handled. Non-lethal methods should always be preferred.

I hope this proposal will be approved and successfully implemented.

Thank you very much for considering my input.

Correspondence: Hello,

All Animals are important to Indigenous people. Some Tribes consider the bear their brother and don't hunt them or like to see others kill them.

Indigenous people have been here longer than anyone else regardless of what History says. All Tribes should have a say in this matter because the United States was all our land before non Indians came here thousands of years ago.

Indigenous people still teach their kids about how important animals are to the Culture. These teachings have been handed down over generations.

Animals are needed to keep balance in our Native world.

People just trophy hunt animals or for the money they can get for them.

Tribal members should have the final say on any animal in the USA, like I said this was our land for thousands of years before our land was taken from us.

This shows that non members want to take more from our Native Culture. We have lost a lot because of non members over thousands of years.

You need to think about what you are doing to Native American People.

If it was flipped to where Indigenous people was the ones to make decisions on what to take away from non Tribal members they would sue the Indigenous people over it because it's part of their lives.

Animals are very important to our way of life and the United States.

Please don't use any personal information on anything. This should be private on who comments or emails you. I don't want people attacking me because of what I said.

Correspondence:	Hello

I'm writing in **\*\*support\*\*** of the Grizzly bear reintroduction and restoration proposal - **\*\*Proposed Action - Restoration as an Experimental Population.\*\***

Support of healthy intact ecosystems is essential for continuity of lands we rely on but have long taken for granted. These healthy ecosystems give us our food, water, air and natural spaces. Restoring Grizzlies to healthy sustainable populations is a way to restore what has been degraded and improve the health and vitality of our region for future generations.

I support the Proposed Action - to actively reintroduce experimental populations of Grizzlies under 10j provisions. The science does not support natural restoration. There is no evidence of a sufficient population in the NCE to allow for Alternative A to work. Passive measures have not worked and there's no evidence they will work any better with time.

I am supportive of the incremental experimental reintroduction plan. Having a smaller but sufficient initial population, allow for study of key indicators, and learn from it and adjust in subsequent years.

Issues I believe need consideration:

Program continuity: given that this will take many years to execute and measure and decades to be successful, we need a way to ensure program continuity that is science based and not based on political whims.

Communities & Tribes: The Grizzly restoration plan must include partnerships and consultation as active stakeholders of tribes in Washington and British Columbia, and communities adjacent to the NCE.

Indigenous Knowledge: The tribes themselves have the deepest history and knowledge and a critical role in understanding the role this species plays in the ecosystem. We need to listen and learn.

Education: A robust education program that dispels myths and educates people on the unanticipated ways a species like Grizzlies can positively impact the ecosystem.

Top Risks & Mitigation plans: Identify top risks to success and have proactive mitigations plans in place.

Continuous Study & Measurement for Success: Have clear objectives we're measuring against - measurements of success in reintroduction, measurements and study of ecosystem impacts, and measurement and monitoring of key risk factors

Thank you for resurrecting this proposal. I look forward to hearing the decision and watching the restoration of our ecosystem and its historic and rich biodiversity.

Thank you for resurrecting this proposal and for your consideration.

Respectfully,

---

Correspondence: I'm writing in support of the effort to reintroduce Grizzly Bears to the North Cascades ecosystem. Many years of living in Washington State and Montana, and thousands of days hiking in the mountains of both have illustrated to me the benefits of a biodiverse ecosystem and the pleasure of sharing a piece of the world with the animals and plants who have evolved for longer than us to live in that world. The North Cascades feel strangely quiet in comparison to the North Continental Divide Ecosystem and would be enlivened by the return of apex predators native to that country: wolves, a few more wolverines, and of course Grizzlies. With so much ecological upheaval underway, I suspect it's difficult to formulate any plan for reintroduction. I think it's difficult for the bears too, the ones who've been dwindling in that part of WA/BC and the ones under consideration for relocation. While I'll be interested to see the ways in which this can be accomplished in relation to the local human populations and realized that these animals won't be reintroduced in a "wilderness" vacuum, I strongly object to any plan involving lethal control of individuals or the population as a whole. The bears'll have enough trouble with roads, harassment (even unintentional) by recreational users, and mast and fruit failures with wacky climatic changes. Living alongside them in Montana taught me that conflicts are comparatively workable, and worth dealing with in creative, non-lethal manners. We'll need their help and cooperation in the reintroduction endeavor, and the more we have around, the better.

Correspondence: I strongly encourage and support actions to reintroduce grizzly bears to the North Cascades, with its 6 million acres of wild land--enough to support a population of at least 200 of these magnificent and iconic animals. Grizzlies are necessary for the proper functioning of the North Cascades ecosystem. They are a symbol of wildness, wilderness, and the American West. And, at a time of massive species and environmental decline, necessary for the preservation of an important, major species in the U.S. Their range once spanned half the continent; now they are found in only 2% of their former range in the continental U.S. Research has shown the North Cascades National Park to provide suitable habitat and adequate food sources. Grizzlies are omnivores: 10% of their diet is meat or fish, and much of that is winter-killed carrion. It's reported that there are more than

100 plant species that grizzlies eat in this area. In the past in the North Cascades, they ate salmon, berries, tubers, roots, deer and small mammals. We need to support the resilience of this species and help balance the ecosystem. Grizzlies are considered an umbrella species. Their conservation will benefit other species. Grizzlies weed out injured and weak deer, elk and small mammals. They turn over the soil searching for roots, and spread seed, keeping plant and animal communities healthy. In other ecosystems where grizzlies live, it is said that they infrequently kill livestock. Their impact on livestock should not be a factor in the decision to restore these native, American animals to the North Cascades. They are solitary and mostly vegetarians. They can be aggressive, but it is reported that people are seldom their prey and fatalities are rare. They benefit the economy by boosting tourism to view these magnificent, charismatic animals, symbols of the wilderness of our heritage.

At a time of drastically declining species in the United States and around the globe due to climate change and environmental destruction, it is crucial now more than ever to save these symbols of our land and history. It is morally wrong to take no action and allow these majestic animals to become extinct. It is our responsibility as stewards of the land, of this country and of all of its inhabitants to take a stand to protect our irreplaceable wildlife heritage. Including the grizzly bear. We have the habitat and the resources to do so. In 2019, several agencies had put up the resources toward an Environmental Impact Statement, but these efforts were squashed by the Trump Administration's Dept. of the Interior. Hopefully, the reopening of this program will finally be successful--and equivalent funding and action will be made available. We must act now and begin the restoration of this amazing animal--without delay.

(Information gathered from articles in "The Seattle Times" (Lynda Mapes 2019 and Isabella Breda 2022), "National Parks" magazine (Kate Siber; Nicholas Bruillard) and the North Cascades Conservation Council website.)

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and

wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: I have lived in Washington state for 35 years and I camp and hike in the North Cascades National Park. I have concerns about the reintroduction of grizzlies which would decrease my use of the park. When I go to Glacier, Grand Teton, or Yellowstone I do not do a lot of the hiking that I would want to nor do I backpack there because of the Grizzlies being there. While I know that a dangerous interaction with them is unlikely I do not feel comfortable taking that small risk. Unless there is going to be a great benefit to the North Cascades National Park region ecosystem I see no reason to reintroduce the grizzly.

Sincerely yours,

[REDACTED]

Correspondence: I support reintroducing grizzly bears to the North Cascades and urge you to ensure that the plan to do so is strong enough to successfully reestablish a healthy grizzly population in this wild and rugged area. The lack of recent evidence of reproduction indicates that a grizzly bear population, as defined in the Bitterroot EIS (USFWS 2000), no longer exists within the North Cascades (NPS and USFWS 2017). Lyons et al. (2018) estimated the carrying capacity of the North Cascades at approximately 278 bears.

The plan that's adopted needs to set up a swift timeline for reintroduction. It should recognize the importance of interaction, breeding, and other species' needs while providing for future considerations related to the bears' long-term recovery. And while species recovery must be balanced with the needs of people, I strongly oppose a rule that would allow landowners to hunt or kill bears on their property. Instead, the plan must focus on nonlethal strategies to address potential conflicts between bears and humans.

Restoring grizzlies to the North Cascades will benefit not only the bears but the entire ecosystem. Additionally, these bruins would facilitate tourism in the North Cascades; my fondest memory of visiting Glacier National Park was in viewing a grazing Grizzly Bear alongside our trail as we grouped together noisily and carefully, and continued on our way.

Correspondence: To Superintendent Striker:

Please include these areas in scoping for the proposal to reintroduce grizzly bears to the North Cascades:

1. Continue and even enhance the ongoing public education and safety measures that have been undertaken for years at campgrounds, trailheads, and throughout the North Cascades National Park and Wilderness ecosystems.
2. As climate change continues to affect natural habitats, it is imperative that measures be included to provide for

prime grizzly foraging habitat for decades to come. Management strategies need to be flexible enough so that meadow habitats for grizzly bears are not lost in the future.

3. Fire management strategies need to be reviewed and perhaps updated to be adaptive and utilize the benefits that naturally-occurring fires (ex. caused by lightning strikes) bring in creating prime foraging habitat for grizzly bears.

4. Not to exclude other species that could potentially be affected by management strategies for grizzly bears, scoping needs to address adverse affects that could result for other species living in the same areas as grizzly bears. Wherever possible, human-induced disruptions should minimize or eliminate disturbances for spotted owls and other listed species.

Thank you for the opportunity to comment on this important issue. It has been decades since the reintroduction of grizzly bears to the North Cascades ecosystem was approved and it is good to see this process gearing up again.

Sincerely,

[REDACTED]

Correspondence:	Hello,

Is this the correct to comment on reintroduction of grizzly bears to the Northwest Cascade ecosystem ?

If so, I would like to say that I am wholeheartedly in favor of this reintroduction to return the environment to a more natural state. As these bears are a keystone species, their presence would also benefit smaller animals and the ecology of this area in general.

Thank you !

Correspondence: IN FAVOR of reintroducing/translocating grizzly bears to North Cascades wilderness. Humans are procreating at an unbridled rate and destroying everything in our paths (unless big bucks are to be made). Grizzlies, on the other hand, are invaluable to the natural balance of our natural world. We all have a moral obligation to save, care for, revere and hold sacred creatures other than humans. Land owning is an unfathomable concept to nature and in nature. Whether it is a lion wandering across an invisible demarcation to be slaughtered by a 'trophy hunter'; or a wolf crossing 'state' boundaries to be killed for 'sport', or grizzlies foraging for food and shot by 'landowners'; this senseless destruction of all that is not human must stop. BTW, grizzlies are primarily herbivores, only preying on animal protein when other sources are scarce.

We are only harming ourselves in the long run...killing the bees with pesticides means no pollinated crops; acidifying the oceans means no kelp beds that support so many types of life including fish for our tables, etc. etc. etc.

As a taxpayer and therefore stake holder (not owner) of our North Cascades National Forests and Parks, I plead on behalf of these magnificent creatures....give them space to roam and forage and mate and raise their young and just let them be...bears, not trophies on the walls of sport killers.

Correspondence: Grizzly bears have lived on this landscape for thousands of years and deserve to be here. Grizzly bears are culturally important to many Indigenous people in the region non-indigenous people who understand the value and importance of bears in our wildlands. Grizzly bears are an endangered species that we must actively recover or risk losing. I want to pass down a wild landscape that includes all native species, including the grizzly. Grizzly bears provide ecosystem services, spreading seeds, cleaning up carrion and aerating alpine meadows, like any other native species. There are few places left in the lower 48 states with habitat as secure, wild and productive as the North Cascades -

or where the federal government plans to restore them.  
I hope to see a grizzly bear one day in the North Cascades.

Correspondence: There are a couple of ways this could play out. It will either be a huge waste of taxpayer money and a sustainable grizzly population will not be established (best outcome), or the bears will do extremely well with no natural predators and no lack of food, and they will cause further decline in ungulate populations, for which there is already little to no predator control.

On the bright side, after a few inevitable and fatal grizzly attacks on humans, like those that have been seen in Idaho and Montana and other states, there will likely become more room at today's overcrowded trailheads. I understand that bear attacks are statistically rare, but how many human deaths would it be worth to reintroduce grizzly's into the North Cascades?

RCW 77.12.035 exists for a reason, don't try to circumvent the spirit of an existing state law for something as unadvisable as this. I recommend the 'no action' alternative.

Correspondence: As a graduate of Seattle University and former Park Ranger/Paramedic at Yellowstone, Yosemite and Grand Teton, I fully support a reintroduction of grizzly bears to the North Cascades.

Grizzly bears are keystone species that positively affect the ecosystem by dispersing seeds, tilling the land, fertilizing forests, and helping to regulate prey species. In addition, grizzlies are true emblems of wilderness that inspire people to get outside and protect our nation's special places.

By working together, I'm confident we can minimize human-bear conflicts and create a successful coexistence between people and bears.

Please let me know if there is anything I help with and I'd be happy to speak publically if needed to help bring these magnificent creature back to the North Cascades!

Correspondence: I support the proposed action to reintroduce grizzly bears to North Cascades National Park. I say so as a life-long backpacker and one who has hiked and camped in grizzly bear country. I accept the small risk of being attacked by a grizzly bear as a small price for restoring this magnificent animal to the North Cascades.

I also feel strongly that the North Cascades needs to be re-evaluated from a fire ecology perspective. I have done some replication work, using the 1930s Osborne Panoramas north of Stevens Pass and at Slate Peak. I see that the area of meadow and shrubland has shrunk over the past eighty to ninety years. Not only have most lightning caused fires been suppressed over the past eighty years, there has been no replacement for indigenous burning, which historically promoted huckleberry production, and various bulbs including Erythroniums. There is a widespread mis-assumption that since the high Cascades is in a cool wet zone, that these ecosystems have not departed from historic condition. It is not the case. There is simply less food produced now for many animals. The fact that mountain goats have never recovered from over-hunting I postulate is due in large part to fire suppression. I have

examined 1930s photos from the Lake Chelan area, and see much shrubland and meadow land on north aspects that has now been treed over, making less forage available for goats and grizzlies.

So reintroduce the bears, but also implement a prescribed fire program in subalpine areas.

Correspondence Type: Web Form  
Correspondence: Thank you for re-pursuing this EIS that was previously put on hold. I support the effort to reintroduce grizzly bears in the North Cascades. Below are my suggestions for consideration in the EIS:

\* When evaluating the potential impact for human-grizzly interactions, please frame the risk relative to other activities that happen within the park. For example, how does the likelihood of a fatal grizzly encounter compare to other fatal events that have happened in the park, hiker medical emergencies, drowning, vehicle collisions, etc.

\* The proposed action includes: "guidelines for management actions to respond to human-grizzly bear conflicts; improved sanitation on public lands". I'm hoping that adding metal bear bins or food hanging wires in the backcountry falls into one of those categories. I think this will be an important piece to include in the proposed action since providing proper food storage options for backcountry users will lead to more consistent food management than relying on users to provide their own containers (like bear canisters). When considering locations for these food container systems, please include areas that are frequented by climbers that are not on established trails (i.e., Boston Basin, the Ptarmigan Traverse, etc.). Mountaineering continues to grow in popularity, bringing more users into the backcountry and away from established trails.

\* I know some backcountry users feel that a fire arm is the only way to protect themselves from bears in areas with grizzlies. I could imagine an unintended consequence of the reintroduction effort is more recreationists carrying fire arms which could carry a risk to other users from accidental shootings. Please consider addressing the need for fire arm safety education and potentially revisiting fire arm laws in the complex. This could be potential mitigation. As someone who spends a lot of time hiking off trail, I worry more about someone being trigger-happy and mistaking me for a predator than I do actually encountering a predator.

Thank you for considering my comments! And a shout out to the individual reading and coding these. Thanks for your good work.

Correspondence: I fully support the restoration of grizzly bears into the North Cascades. They are a key species and until recent decades, have lived and prospered in the abundant and supportive North Cascades ecosystem. They were eradicated from their home from habitat loss, excessive hunting and mismanagement of conflicts between humans and their livestock. I believe it is not only a conservation and preservation priority, but also a moral obligation to establish the North Cascades as their home land once again. The reintroduction of the wolf population to Yellowstone brought a recovering ecosystem, natural biodiversity, increased tourism, boosts to the local economy, educational opportunities and greater cooperation between private land management and wildlife. This is a successful example of how the grizzly could and should be introduced back into the North Cascades.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

- Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone. Below are some common sense actions.

- Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

- Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

- Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no

motorized equipment, and no invasive monitoring.  
Thank you!

Correspondence: Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.  
The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.  
But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife.

Correspondence: Protect our essential wildlife and their habitat.

--Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

--Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

--Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

--Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness.

If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I am writing in regards to ask you to reconsider your approach for grizzly recovery in the Cascades.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing."

A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

Please reconsider this approach and the idea of an "experimental" population. Instead, analyze a natural recovery alternative, one that doesn't violate the Wilderness Act.

Thank you for your attention to this matter.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness.

If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Please let the authorities on Grizzly Bears guide your decisions. These are majestic Bears, and they need to be protected and helped to increase in numbers.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Correspondence: The current plan by NPS and FWS to relocate grizzlies is misguided in many ways.

First of all: why in heaven's name would any agency think it was a good idea to capture bears that might lose their current protections under the Endangered Species Act (ESA)? These bears could be shot, re-captured, or killed in the North Cascades. This is not protecting them!

Secondly: The definition of "Wilderness" means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment, without trammeling or manipulating Wilderness or its wildlife. This plan stomps on the definition of Wilderness.

Third: This plan would initiate heavy-handed management that would not only be detrimental to Wilderness, but to bears as well. The bears would be subjected to initial capture, handling, and helicopter flight, and attendant

stress from such activities.

Some may be injured or even die as a result!

How is that being protective of wildlife?

They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

To conclude, a plan is needed that might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears.

A longer timeline would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Please consider these arguments and re-think your misguided proposal.

Correspondence: The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

Our ecosystems are already fragile and I don't think your plans are the right solution.

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. Please don't do this. It's an awful plan. I do animal rescue and we never bring animals to another location

especially in another state. It's illegal in Massachusetts to relocate wildlife. You'll be jeopardizing their very existence.

Correspondence: In complete agreement with Wilderness Watch I submit the following comments:

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone

I Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

The National Park Service sorely needs to do a better job and analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

The National Park Service must develop an alternative that doesn't violate the Wilderness Act - an obvious requirement. The agency(ies) must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect

corridors and connectivity so that bears could move across the border without getting killed.

Please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: As someone who cares deeply about the well-being of our Earth and all creatures who share it, I support the recovery of grizzly bears and other native species where suitable habitat exists. Recovery efforts must meet the requirements of the Wilderness Act, as heavy-handed management would not only be detrimental to Wilderness, but to bears as well.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies.

Please consider the following:

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population

and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for considering my thoughts.

Correspondence: I join all those expressing their opposition to the capture of grizzlies from the Northern Continental Divide Ecosystem.

As you know, federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does NOT rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. I ask you to analyze a natural recovery alternative. This is NOT the same as the "No Action" alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure grizzlies are protected on BOTH sides of the border. Under this alternative, agencies would identify and protect corridors and connectivity so bears could move across the border without getting killed.

I also ask you to develop an alternative that doesn't violate the Wilderness Act. The necessary agencies must not pursue alternatives that would violate the Wilderness Act by including heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Hello,

I would like to encourage you to reconsider your approach to grizzly recovery in the North Cascades.

Please consider the following points:

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect

corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Regards,

---

Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

I think you should analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify

and protect corridors and connectivity so that bears could move across the border without getting killed.

I support the development of an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

I support the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, I take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: We LIVE with the great BEARS of the West. The current plans to relocate bears into the Northern Cascades is NOT being "mindful" of the bears OR the Wilderness Act. This must NOT be designated an "experimental population"! Really, Folks.

You KNOW this! Taking individual BEARS out of their home range/s (including Montana?) they will LOOSE their Endangered Species Act protection (and in Montana, we already have all kinds of horrible examples of violating even IT!). PEOPLE should KNOW this by now!!! Bears are NOT TOYS to be tinkered with!

PLEASE!! ANALYZE a Natural RECOVERY Alternative!! Good intentions are NOT enough. RESPECT for the species as a whole -- and we've learned SO much from both successes and, painfully, from DISrespectful actions -- MUST be the Guiding Light in your work.

Speaking for the Bears who NEED passionate, informed CHAMPIONS (YOU could be among them!?!),

██████████

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Also, develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Re: 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement

Relocating grizzlies from BC, CA to the Northern Cascades leave both area w/ a severely limited population in both areas, a reduced gene pool and harder to recover in either area.

Grizzlies relocated to the Northern Cascades will lose endangered species status though they will in fact remain so.

As such the current relocation plan is ecologically and legally compromised and should be withdrawn for further consideration.

Thank you

Correspondence: It seems to me its about time to put research & thought into creating habitats where grizzlies & other animals can MIGRATE from one wilderness to another.

Capturing bears from one area - breaking up families, possibly - to start a population in another and at the same time removing protections from these bears, sure does lack common sense.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Please reconsider your approach to grizzly bear recovery in the north cascades.

I Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also urge you to Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Correspondence: I am writing to offer improvements to the current grizzly relocation plans, to wit:

1. I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

2. I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

3. The Service needs to analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

4. Finally, the Service must develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your attention to my comments.

Correspondence: To whom it may concern:

I am writing to encourage the The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) to reconsider their approach to grizzly recovery in the North Cascades.

Specifically, I encourage the agencies to take the following actions:

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your thoughtful consideration of these recommendations, which I hope will be implemented by the NPS and FWS.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from

the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Sincerely,

  
Baierbronn  
Germany

Correspondence: Please provide reintroduction of the grizzly bear into the North Cascade region of Washington State using the LEAST intrusive methods for designated Wilderness and the existing population of

Grizzlies in the Glacier Nation Park region. It makes no sense to take from a limited population in Gracier Park and move them to the North Cascades.

Do NOT allow any usage of the Wilderness areas outside of written agreements that are current. No motorized use. No invasive equipment. No noise. No large intrusions.

Let this reintroduction be natural without hunting and trapping.

I have spent many trips into the North Cascades Wilderness area and have first hand knowledge of the land and its wild beauty

Thank you

  
A concerned US citizen.

Correspondence: Taking the grizzlies from northern populations is not a good idea, in that these northern populations aren't yet fully established themselves. Why weaken a population that is just getting established to form another? Then you risk losing both and nothing is accomplished.

The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Remember, the bears are our first and only concern when manipulating and moving them is involved. Grizzlies must be protected on both sides of the border with British Columbia and the U.S.

This is a very important project and must be done right.

Comments Needed on Plan to Recover Grizzlies in North Cascades	

The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of

helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. I agree with what I read in the email

Correspondence: The human race has nearly wiped the whole animal kingdom into pure starvation and extinction so the human race can engage in procreating activity in the billions upon billions; now at 8 billion humans. This is insane procreating activity the human race is doing with no compassion for anything else, no compassion for other species or even the planet.

These magnificent beautiful animals (also along with all animal species and birds) belong to this planet and deserve the right to live, be free and protected from humans and human destructive activity which has wiped out and nearly wiped the whole animal kingdom into starvation and extinction so the human race can engage in procreating activity in the billions.

We are now at 8 billion humans and this procreating activity continues compliments of human right idiots, who have given trillions of free international aid money for six decades or more for the human race just to procreate 8 billion people plus plus. These human right people are satanic, Lucifer's angles. They have nearly destroyed the whole planet wiping everything to extinction, starvation and encouraging people just to procreate billions.

These so called human right people have given trillions of free international aid money for six decades or more for the human race just to procreate 8 billion people plus plus. These human right people are satanic devils, Lucifer's angles. Their goal is to totally destroy this planet; i.e., biblical scripture, Lucifer's angles. We are not far away from a total dead planet with all this human race procreating activity, pure selfish and extreme laziness with big, fat lazy finger syndrome, just press a number with modern technology, while the whole animal kingdom is malnourished and starving to death compliments of human right idiots. Let's not pretend when it comes to these human right idiots. These human right idiots care nothing for their own people or their own people in need. The animal kingdom, their welfare along with protecting this planet means nothing to these so called human right people.

Correspondence: In regards to the plan to recover Grizzlies in North Cascades:

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Sincerely,

[REDACTED]

Correspondence: Messing around with Nature is always very risky. We often cannot anticipate what the consequences will be. Too often they are bad. We cannot control Nature. It is the height of conceit to dare to try to do so.

Abducting grizzly bears from one area and putting them in another will not work out at all well. Too few would be left in place. The ones relocated would be isolated. They would lose their protected status under the ESA. Bad!

Grizzlies should be left where they are and allowed to thrive, both in Canada and the U.S. Just look at what a mess we human beings have made of this planet. Non-interference can be more benign than meddling.

If there is to be action of any kind taken, it must comply with the Wilderness Act. That law exists for a reason. It is unacceptable to ignore it to suit someone's convenience or grand schemes.

Thank you for your consideration.

Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Recover Grizzlies in North Cascades! We are encouraging the "National Park Service" to reconsider your approach to, grizzly, recovery in the North Cascades! We are encouraging the "National Park Service" and the the agencies to reconsider your approach to grizzly recovery in the North Cascades.

You have re-started your plan to translocate grizzly, bears into the "North Cascades Ecosystem" in Washington. While a, new, population of grizzlies, in the North Cascades, would restore this, magnificent, species to that ecosystem, your Agencies' initial, plan is misguided, in many, ways!

You MUST analyze a, natural, recovery alternative! This is NOT the same as the "No Action" alternative. Under a, natural, recovery alternative, the FWS" and the "NPS" would, actively, work with agencies, in British Columbia, to ensure that grizzlies are protected on, both, sides of the border! Under this alternative, the Agencies would identify, and, protect, corridors, and, connectivity, so that bears could move across the border without getting killed!

Your, proposed, action lacks a, natural, recovery option! The, best, way to meet the goal of a, viable, grizzly population, in the North Cascades, would be to allow for, and, boldly, promote, the, natural, recovery of grizzlies! This is a, very, different approach than the "no action" option, which is to "do nothing"! A, natural, recovery alternative would require working, with British Columbia, to protect grizzlies over a, larger, land base, and, would provide for connectivity between populations in the U.S. and Canada using, protected, habitat corridors. It MUST, also, include, other, measures to ensure that grizzlies are NOT killed by humans, regardless, of what side of the border they are on, and, whether they are in "National Parks", Wilderness, or other, public, or, private, lands. It might take longer, and, require, more, patience than the, instant, gratification of capturing, and, releasing, dozens of bears, but, it would, ultimately, create a, more, durable population sharing the landscape with a, human, population that is, more, likely to respect the bears that make it back to the North Cascades on their own!

Your, initial, plan would, most likely, degrade Wilderness in the North Cascades, weaken the, grizzly, population in the "Northern Continental Divide Ecosystem" around "Glacier National Park", and, strip the, individual, grizzlies of their, current, protections under the "Endangered Species Act"! During your, initial, "scoping" period, the public has the opportunity to tell your Agencies how to improve, your, tentative plan!

The, proposed, 6.1 million-acre, recovery, area includes "North Cascades National Park", and, 2.6 million acres of Wilderness in the "Pasayten", "Mt. Baker", and "Stephen Mather Wildernesses". Under your, proposed, action, the "NPS" and the "FWS" would capture bears from, source, populations in either, interior, British Columbia, or, the "NCDE". Approximately 3 to 7 captured, grizzly bears would be released into the "NCE", each, year over, roughly, 5 to 10 years, with a goal of establishing an, initial, population of 25, grizzly, bears.

Your, proposed, action includes a, problematic, proposal to designate the, reintroduced, grizzly bears in the "NCE" as an "experimental population" under "Section 10(j)" of the "U.S. Endangered Species Act". Under this designation, the bears (at least, any captured in the U.S.) would lose their, current, protections under the "Endangered Species Act", and, could be shot, re-captured, or, killed in the North Cascades!

Our family supports the recovery of, grizzly, bears, and, other, native species where, suitable, habitat exists. The, rugged, North Cascades are, historic, grizzly bear habitat, and, there may, still, be a few, currently, living on the U.S. side of the border, with a, grizzly, bear photographed there in 2010.

We, strongly, oppose the capture of grizzlies from the "Northern Continental Divide Ecosystem"! The federal agencies plan to kidnap bears from either, British Columbia, or, the "Northern Continental Divide Ecosystem" around "Glacier National Park" to move to the North Cascades. But, grizzlies have, still, not recovered in the "NCDE", and, there are NO "extra" bears there to move to Washington! Such a plan would weaken the "NCDE" grizzly, population, and, diminish the likelihood of developing the, needed, population linkages between the "NCDE" grizzlies, and, those, elsewhere, such as in Yellowstone!

But, recovery, efforts MUST meet the requirements of the "Wilderness Act"! This means restoring the area's, grizzly, population without the use of, motor, vehicles, helicopters, and, motorized, equipment in Wilderness, without trammeling, or, manipulating, Wilderness, or, its wildlife! However suitable the habitat in the North Cascades is, we take issue with the methods, likely, to be used--the, reintroduction, plan could be, extremely, intrusive in, designated, Wilderness, could rely on activities prohibited by the "Wilderness Act", and, could come at a, significant, cost to Wilderness!

Your plan's, proposed, helicopter landings would, most likely, occur either in Wilderness in "North Cascades National Park", or, in Wilderness within the, surrounding, "National Forests", despite most of the, project, area being outside of Wilderness! The, extensive, use of helicopters, in Wilderness, would continue, indefinitely, for monitoring, bear, movement, and, numbers, and, would degrade the Wildernesses

involved!

Heavy-handed management would, not only, be detrimental to Wilderness, but, to the bears as well, as they would be subjected to, initial, capture, handling, and, helicopter, flight, and, attendant, stress from such activities! Some may be injured, or, even die as a result! They would, likely, be collared, drugged, subject to samples taken, and, handled for, many, years. And, if that were not enough, your, proposed, plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies!

It is, also, questionable whether a, translocation, plan will be successful without, Canadian, support! Information is lacking on the status of grizzlies on the Canadian, side of the border though this area is crucial in, any, success, as bears wander between the U.S. and British Columbia in the "North Cascades Ecosystem";

The, essential, irony is that your Agencies recognize the, best, place to release bears is in the, exceedingly, rare wildness of the "North Cascades". The, best, grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning, sites, safety from, human-caused, mortality, and, distance from, human, conflicts, and, garbage! But, your Agency's, proposed, methods of re-establishing grizzlies diminish all these advantages!

If the "Park Service" adopts a, translocation, plan, it MUST be in line with the letter, and, the spirit of the "Wilderness Act"! Monitoring MUST take place in a way that is respectful to Wilderness, and, the bears, including using, hair, snags, camera, traps, scat, collection, and, on-the-ground, sightings to know whether the bears are thriving. It is, morally, wrong to rely on, intrusive, radio-collaring, helicopter, landings, and, ongoing, sedating, capturing, and, handling, of the bears!

You MUST develop an alternative that does NOT violate the "Wilderness Act"! Your Agencies MUST not pursue alternatives that would violate the "Wilderness Act", and, would entail heavy-handed, stressful, management of bears! Should the "NPS" choose to translocate bears, your Agency MUST, first, consider limiting translocation to sites outside of Wilderness! If the "NPS" decides to translocate within Wilderness, it MUST comply with the "Wilderness Act": NO helicopters, NO motorized equipment, and, NO, invasive, monitoring!

We, strongly, oppose an "experimental population" designation! Your Agencies MUST create, and, analyze, an alternative that does NOT rely on the, so-called, "experimental" population designation! Under such a designation, individual, bears from the "NCDE"--which are, currently, protected under the "Endangered Species Act"--would be taken from their, home, range and, transported to Washington state, where they would lose their protections under the "ESA"!

Correspondence: The National Park Service (NPS) and the U.S. Fish and Wildlife Service (USFWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways. The initial plan would most likely degrade wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the USFWS would capture bears from source populations in either interior British Columbia or the Northern Continental Divide Ecosystem. Approximately 3 to 7 captured grizzly bears would be released each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears. The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the North Cascades Ecosystem as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act and could be shot, re-captured, or killed in the North Cascades.

I support the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating wilderness or its wildlife. However suitable the habitat in the North Cascades is, I take issue with the methods likely to be used, the reintroduction plan could be extremely intrusive in designated wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to wilderness.

It is also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It is wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Develop an alternative that does not violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

The best grizzly habitat is synonymous with wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

Correspondence: Please reconsider your grizzly recovery plan for the North Cascades because it is misguided in many ways. It needs improving.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

I support the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of

Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wilderness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: Please save our treasured wildlife and wild places, specifically our grizzly bears, as follows:

-Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

-Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

-Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect

corridors and connectivity so that bears could move across the border without getting killed.

-Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thanks for taking these actions now. Save the bears!

Correspondence: Comments Needed on Plan to Recover Grizzlies in North Cascades

The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would this species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

By designating bears as "experimental", the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades. PLEASE NO!

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies.

Thank you for accepting comments.

Correspondence: Dear NPS:

Please reconsider your approach to grizzly recovery in the North Cascades. Some thoughts are outlined below.

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for considering my request.

Sincerely,

[REDACTED]

Correspondence: Please THINK about this proposal, and act as you are PAID to act. Protect our wild land and places. DO YOUR JOBS

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Correspondence: Analyze a natural recovery alternative:

This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: I oppose moving grizzlies from one ecosystem to another. Grizzlies need to recover in the NCDE before any can be moved to a new location.

Grizzlies are still in need of protection under the ESA.

The FWS and the NPS must work together with agencies in British Columbia to ensure grizzlies are protected in both Canada and the US.

No changes should be made if they violate the Wilderness Act.

Thank you, [REDACTED]

Correspondence: Please consider these points with regard to recovering Grizzly bears in the North Cascades;

Please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

In addition, the agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Also, please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure

that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Moving bears from one ecosystem where they are not fully recovered to a new area is not a viable solution. Help the bears that are left to recover in a healthy and wild environment and establish a healthy and sustainable population that maintains a well balanced ecosystem in the North Cascade ranges.

Thank you for considering my concerns and suggestions.

Correspondence: Grizzly Bears are icons of wilderness and key predators in the ecosystems where they still survive. Bear management doesn't have to be an orgy of darting, collaring and sampling but can be done non intrusively as well through camera and hair traps etc...

It is vital to not throw out the baby with the bathwater, that is not destroy the essence of wilderness while trying to protect it. Helicopters, trucks and other machines typically banned from wilderness should not become easily accepted, even while the goal of protecting Grizzly Bears is laudable.

Best,

  
Colorado Springs, CO

Correspondence: On behalf of bear populations in designated wilderness areas, I appreciate your consideration of this request.  
Please develop an appropriate, sensible, long-term plan that doesn't violate the Wilderness Act. Involved agencies are encouraged not to pursue alternatives that would violate the Wilderness Act and entail unnecessary stressful management of bears.  
Should the NPS choose to translocate bears, the agency might first consider limiting translocation to sites outside of Wilderness. And if the NPS decides to translocate within Wilderness, it needs to comply with the Wilderness Act, which includes no loud noises produced by machines, such as helicopters and motorized equipment. Also, invasive intrusions into wilderness areas to monitor bears should be limited.  
Thanks for all you do to protect the limited wilderness areas remaining for wildlife, as well as humans.

The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. Correspondence: I vehemently oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. It is unconscionably premature for the federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades as grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
  
Instead use your mature human brain and analyze, visualize, develop and employ a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.  
  
And, finally, develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue

alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence Type: Web Form  
Correspondence: I fully support the reintroduction of grizzlies in the Northern Cascades. However, this needs to be managed in the right way to maximize the chances of a successful reintroduction, maximize the welfare and protection of the bears, and minimize impacts on Wilderness areas.

I have serious reservations regarding the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to take bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I strongly oppose the "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

I want to see serious consideration of a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

I want to see maximum efforts made to work out an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you.

But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Grizzly bears should not be relocated. Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: I am an ecologist and educator in North Carolina. I am writing to support the idea of grizzly bears returning to Washington state. I think the best way to do that would be through development of natural corridors to encourage movement of bears into the state, rather than uprooting bears from existing, protected populations.  
Since the existing populations are still recovering, it is best to make sure that the bears are protected and not uprooted and moved by force. Also, it is important to make sure they are protected in the new habitat in Washington, so they have the best chance of starting a new population. I am opposed to the experimental population designation if it requires capture of bears by force, and loss of protections for bears in Washington state, through the endangered species act.

Correspondence: The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Correspondence: The NPS needs to develop an alternative that doesn't violate the Wilderness Act. All agencies should never pursue alternatives that violate the Wilderness Act and entail heavy-handed, stressful management of bears. We've seen the same thing over and over, once man starts to interrupt nature, something bad happens in the eco-system that man touches.

If translocation is the only option, translocate the bears within the Wilderness and must comply with the Wilderness Act, "no helicopters, no motorized equipment, and no invasive monitoring".

Correspondence: If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: Thank you for considering my thoughts in regards to the National Park Service and FWS plan to recover grizzlies in the North Cascades. I support the recovery of grizzly bears. When my son and I visit numerous parks and monuments and forests throughout the country, we have found over the years that the majority of Americans want to shoot wildlife with cameras rather than with guns.

In reading about your ideas around the grizzly, which are highly commendable, I have several questions. I think that certain groups are making good points when they state that recovery efforts need to meet the requirements of the Wilderness Act, a marvelous piece of legislation, which considers wildlife and wildlands for our children's future. The idea of using capture, sedation and helicopters seem rather extreme. In the environmental movement, we are now hearing about wildlife corridors, which I think is incredible.

Thank you for reading this,

  
Colorado

Correspondence: Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. No agency should ever be making proposals or recommendations that do not comply with the laws.

Also, you should oppose the capture of grizzlies from the Northern Continental Divide Ecosystem- it is inconsistent with the science and evidence.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

You must also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. This is antithetical to both the intent and letter of the law.

Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

I look forward to revision that complies with all relevant statutes in both intent and letter of the laws.

Correspondence: I categorically oppose the trapping/taking of grizzly bears from the Northern Continental Divide Ecosystem. The federal agencies plan to take bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades.

Grizzlies have not yet recovered in the NCDE, and there are no "surplus" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they forfeit their protections under the ESA. This is NOT acceptable and would endanger the bears.

The plan must include a natural recovery alternative. This is NOT the same as the No Action alternative. Under a

natural recovery alternative, the FWS and NPS would be required to actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Thank you.

Correspondence: I am writing in support of saving grizzlies and all bears, wolves, wildlife of any kind. Unfortunately, the history of humans &quot;managing&quot; wildlife is one long, sordid tale of greed, cruelty, stupidity and extinction. I hope that any new plan to save bears and other top predators would focus on saving the existing populations, protecting them from humans and increasing the animal's opportunities to expand their range naturally. I'll add some suggested boilerplate here with which I agree.  
Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Correspondence: The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: This "scoping plan" must be sent back to the drawing board, for if enacted would be in violation of both the Endangered Species Act and the Wilderness Act. Specifically: I Oppose the physical capture of grizzlies from the Northern Continental Divide Ecosystem (NCDE). Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to the State of Washington. Such actions would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in the Greater Yellowstone ecosystem.

I also Oppose an "experimental population" designation. By law, the agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. The plan or any alternative must also not violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence:	I respectfully submit my comments below regarding the proposed plan to translocate grizzly bears into the North Cascades:

The proposed plan has many issues that will not serve the best interests of the public, public wilderness lands and the grizzly bears.

1. I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades poses a significant problem. First of all, the grizzly bear population has not even recovered in the NCDE. How will the few in the region even be found to move to Washington state?
2. I oppose the idea of an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
3. A natural recovery alternative needs to be analyzed and developed. This is NOT the same as the 'No Action' alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
4. Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

What has been proposed will, in all probability, degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park and strip the individual grizzlies of their current protections under the Endangered Species Act. That is -- with all due respect -- not a plan that serves the best interests of the public, the land or the grizzly bears which are still endangered as a species.

Correspondence: The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Correspondence: Dear NPS and FWS,

I am writing to strongly urge you to oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies' plan to capture bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades is a very bad idea since grizzlies have still not recovered in the NCDE. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

This is just a very dumb plan. There are humane options that must be seriously considered.

Correspondence: If moving raccoons out of suburban neighborhoods and putting them into nice forests doesn't work, why is it a good idea to move grizzlies? Where they are now is their home. They'll be as happy to leave it as you would be, and they'll try to get back, just like you would.

Why would it be a good idea to take some grizzlies away from where they're protected by the Endangered Species Act and out them where they aren't protected? Let's change the law first, so they'll be protected \*before\* trying to find a way to make grizzlies happy there.

The idea of Canada and the US working together to make a safe corridor for grizzlies to naturally move around sounds sensible and logical. Why is it controversial?

Heavy-handed, stressful management of wildlife sounds as appealing as heavy-handed, stressful management of people. Let's not treat intelligent creatures like toys. Let's look at what works for them--living freely and being able to cross international borders without getting killed.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Dear Sirs,

Grizzlies are iconic and a miracle of nature. They deserve all protection!

A new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an

"experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Sincerely Yours,

---

Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

We need to develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Correspondence: Dear National Park Service,

I oppose the current proposal to capture grizzly bears from the Northern Continental Divide Ecosystem. Federal agencies, including NPS, plan to remove grizzly bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park and then move them to the North Cascades.

Grizzly bears have not recovered in the NCDE. There are no excess bears in the NCDE to move to Washington State. This plan would weaken the NCDE grizzly bear population and reduce needed population linkages between the NCDE grizzly bears and others, like those in the Yellowstone National Park area.

I also oppose any "experimental population" designation. NPS and other agencies must create and analyze an alternative that doesn't rely on the "experimental" population designation. An "experimental population" designation, would remove grizzly bears from the NCDE that are protected under the Endangered Species Act and transport them to Washington State, where they would lose the protection of the

Endangered Species Act (ESA).

NPS and U.S. Fish and Wildlife Service (FWS) should analyze a "natural recovery" alternative. A "natural recovery" alternative is not a No Action alternative. A "natural recovery" alternative requires that the FWS and NPS work with agencies in British Columbia to ensure that grizzly bears are protected on both sides of the border. This alternative would identify and protect corridors and connectivity so that grizzly bears can move across the border without being killed.

NPS must prepare an alternative that doesn't violate the Wilderness Act. NPS and FWS mustn't approve alternatives that violate the Wilderness Act and require stressful management of grizzly bears. Should the NPS choose to translocate grizzly bears, it should first limit translocation to sites outside of Wilderness. If the NPS wants to translocate grizzly bears within Wilderness, it must comply with the Wilderness Act. This means no helicopters, no motorized equipment, and no invasive monitoring.

I don't support trammeling of wilderness when translocating grizzly bears. If NPS and FWS will not abide by the requirements of the Wilderness Act, then I support no translocation of grizzly bears.

Correspondence: I write as a regularly voting and active US citizen, and trained environmental scientist, to voice my concerns regarding the NPS and FWS grizzly plan for the North Cascades Ecosystem.

I definitely support Grizzly reintroduction, and rewilding, in general, but it must be done in sustainable and reasonable fashion.

First, grizzlies should not be captured from the Northern Continental Divide Ecosystem. Grizzlies are still recovering in the NCDE and it would seriously harm their recovery.

Second, a natural recovery alternative should be pursued (not, I should emphasize, the 'No Action' plan). Please work with Canada to ensure that grizzlies are protected on both sides of the border.

Finally, please rethink the approach so that you are not violating the law - the Wilderness Act. At the very least, first consider limiting translocation to sites outside of Wilderness. Anything that occurs within Wilderness must comply with the Wilderness Act (e.g., no helicopters and no invasive monitoring).

Thank you.

Correspondence: Hello,  
Please reconsider your approach to grizzly recovery in the North Cascades.

1. Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
2. Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
3. Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
4. Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thanks,

Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence:	To whom it may concern,

We encourage you to reconsider your approach to grizzly recovery in the North Cascades.

We oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

We oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Please develop an alternative that doesn't violate the Wilderness Act. Correspondence: If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population

in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies.

The agencies would identify and protect corridors and connectivity so that bears could move across the border from Canada without getting killed.

The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. This is wrong.

Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

And develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. Correspondence: I'm writing to respectfully urge you to reconsider the plan for Grizzly Bear recovery in the Cascades:

I'm against the capture of grizzlies from the Northern Continental Divide Ecosystem. The recovery plan is to take bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park and relocate them to the North Cascades. The obvious problem with this plan is that grizzlies have not yet recovered in the NCDE. They are NO "extra" bears there to move to Washington state.

I also take issue with the "experimental population" designation. There needs to be an alternative that does not rely on the so-called "experimental" population designation. Under this designation, it is

possible that bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

You need to consider a natural recovery alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. If you afford this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Lastly, if the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Correspondence: - Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

- Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

- Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Capturing grizzlies from the Northern Continental Divide Ecosystem is not a good idea. Federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. This plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

The "experimental population" designation is not a good solution. Agencies must create an alternative that does not rely on the so-called "experimental" population designation. Under this designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. Instead develop a natural recovery alternative, which is NOT a No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure grizzlies are protected on both sides of the border. Agencies would identify and protect corridors and connectivity so bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. Agencies must not pursue alternatives that violate the Wilderness Act and entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your consideration of these recommendations.

Correspondence: I write in opposition to the capture of grizzlies from the Northern Continental Divide Ecosystem and the creation of an "experimental population".  
I oppose the capture of grizzlies because grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Thus, such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
I oppose the "experimental population" designation because under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range

and transported to Washington state, where they would lose their protections under the ESA.

Therefore, I strongly encourage you to analyze a natural recovery alternative, which is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

And logically I expect you to develop an alternative that DOES NOT violate the Wilderness Act. The agencies must NOT pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it MUST comply with the Wilderness Act: NO helicopters, NO motorized equipment, and NO invasive monitoring.

Thank you!

Correspondence: I am writing because grizzly bear recovery efforts require careful consideration.

As such, I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. This should not be allowed to happen because grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. If bears were moved, it would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. Agencies should create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. This would be disastrous for grizzly populations in both locations. These bears must continue under their protected status.

I support a natural recovery alternative, which is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Agencies need to develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no

helicopters, no motorized equipment, and no invasive monitoring.

Please protect these bears at all costs. Their numbers are fragile, and we must do all we can to protect wildlife.

Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone. While grizzly bears may well acclimatize in the Cascades mountains, they were never a native species, and I don't think it is a wise plan to steal bears from successful habitats to place them in an area that is non native. Our locals can't even handle the idea of a wolf population, now you want to introduce a more aggressive species into the mix? This will not end well for humans nor bears....

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone. I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. Thank you for considering my comments.

Correspondence: I urge your agencies to reconsider their approach to grizzly recovery in the North Cascades. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

I support the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act.

This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, I take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National

Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: Although not written by me these comments expressed what I think and feel about protecting grizzlies and strongly hope you feel and act the same way!

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. Thanks.
