Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Please reconsider the current plan to relocate grizzly bears from British Columbia or the Northern Continental Divide Ecosystem (NCDE) to move to the North Cascades. Because the grizzly population has not recovered in the NCDE, this plan would weaken the NCDE grizzly population, creating a new problem by trying to fix another. Doing this using the "experimental" population designation also removes bears from a location where they have protection under the Endangered Species Act and puts them in a location where they would lose their protections under the ESA, putting them in greater danger.

Instead, a long-term approach of protecting grizzly bears from humans, retaining and restoring their habitat, and creating wildlife corridors to connect US and Canadian wilderness would allow the population to expand and recover more naturally with minimal human interference. This creates less stress on the animals and improves the overall species recovery instead of just shuffling the existing bears around.

Correspondence: The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years,

with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: I think grizzly recovery in the North Cascades is very important. However, I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. There are no "extra" bears there. Instead, please analyze a natural recovery alternative and then develop an alternative that doesn't violate the Wilderness Act. It's not okay to decimate one area in order to help another. Nature works in a balance, as you know. It's important to honor that balance. Please allow and promote the natural recovery of grizzlies. This is definitely not "do nothing," called "no action."

It is humans who have upset the balance of nature. We need to back off and protect the recovering grizzlies from us. Learn about and support their natural recovery.

thank you,

Correspondence: • Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
• Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
• Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.  
• Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I think reintroducing grizzlies is a great idea. Seems that most wild animals that have been killed in high numbers to reduce populations, and/or relocated for whatever reason is a disservice to the lands they're removed from along with the trauma of relocating grizzlies to imperfect areas with vastly different habitats than what are required for this animal to thrive. So to reintroduce these misunderstood creatures they should first be brought back into areas they've been taken from because nature has done a much better job than humans at knowing what said animals need to survive and thrive and this land supported them prior to their forced removal or wrongful killings. Predators are a necessary part of life in the wild and grizzlies play a significant part in these lives. When most predators are removed everything changes including previous habitats and it may be hard on known ecosystems. Nature is much better at overseeing "the kill or be killed" thoughts in most humans, but here nature comes out on top of human ideas. Maybe it's time to allow America's wildlife members to define the proper ratio again as it was before many humans had their say (many times it was wrong). A problem that must also be dealt with are the large numbers of cattle grazing in what once was lands where predators roamed. If more humans could get away from their love of red meat a lot of problems could be solved or initiated at least. With cattle taking over lands designed in nature for predators like grizzlies there is an imbalance and the predators are easier to kill than for many to give up their obsession with meat which is ridiculous. I gave up meat entirely 22-25 years ago and miss nothing!! So we know there are truly options facing the future. Thank you.

Correspondence: Hello,

I am writing to express my thoughts about the plan to translocate grizzly bears into the North Cascades Ecosystem in Washington.

I oppose the capturing of grizzly bears from the NCDE to be relocated in the North Cascades, as the population is still recovering. Doing so would be detrimental to the NCDE grizzly population, and therefore be counterintuitive to repopulating another area. Grizzlies simply can't be moved when the population isn't already thriving.

I also question the "experimental population" designation. While grizzlies in the NCDE currently have protection under the Endangered Species Act, if they are moved to Washington, this protection would be lost. Again, this seems counterintuitive for an animal population that still needs protection.

There should be an analysis for a natural recovery alternative that supports protection for grizzlies both in the United States and Canada. This can be done through partnership with agencies that are able to identify and

protect corridors in which bears can safely move across the borders without harm.

When seeking an alternative, the integrity of the Wilderness Act must be preserved. Strategies that will harm bears is simply unacceptable under the provisions of the Wilderness Act, and absolutely must avoid any invasive monitoring or use of motorized equipment. These are living, wild creatures, and the effects of invasive strategies will further impact their already diminishing safety.

I trust that you will take my comments with sincere consideration and act in the best manner possible for the grizzly population.

Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem: the federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation: the agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative: this is NOT the same as the No Action alternative. Correspondence: Reconsider their approach to grizzly recovery in the North Cascades.

I speak from experience. In the 1980's CA thought it helpful to spread the sea otter population up and down the west coast rather than leave it alone as it was recovering. Most of those transplanted died. Those that survived came back to the Central Coast.

Therefore, I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. And, I oppose an "experimental population" designation.

Rather, analyze a natural recovery alternative. Develop an alternative that doesn't violate the Wilderness Act. Don't act like the arrogant humans we usually are.

Correspondence: Habitat for grizzlies in the North Cascades is so important this ecosystem has been identified as one of the few remaining in the contiguous U.S. capable of supporting a viable grizzly bear population, and the only recovery area outside of the Rockies. Recent research estimates that the North Cascades ecosystem could ultimately support more grizzlies than live in Yellowstone National Park, a globally renowned destination for bear-watching.

You must not remove any of them. We must find ways to protect them.

It's been a while since we've coexisted with grizzlies and some of us are wary. But careful bear management,

human safety and "bear awareness" would be top priorities during the recovery process and Washingtonians already know how to share the landscape with wildlife. We can't miss this long-awaited opportunity to make nature whole again. Leave the Grizzlies be.

Correspondence: The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence Type: Web Form  
Correspondence: Dear National Park Service,

Please, I ask that you reconsider your approach to grizzly recovery in the North Cascades.

I OPPOSE THE CAPTURE OF GRIZZLIES FROM THE NORTHERN CONTINENTAL DIVIDE ECOSYSTEM.

Is it true that the federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades? But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

**I OPPOSE AN "EXPERIMENTAL POPULATION" DESIGNATION.**

The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

**PLEASE ANALYZE A NATURAL RECOVERY ALTERNATIVE.**

This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

**DEVELOP AN ALTERNATIVE THAT DOESN'T VIOLATE THE WILDERNESS ACT.**

The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you so very much in your consideration and action on this.

But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their

protections under the ESA.

Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for considering my comments.

Sincerely yours,

[REDACTED]

Correspondence: RE: Grizzly Bear Recovery in the Northern Cascades.

I support the following points by Wilderness Watch to encourage the agencies to reconsider their approach to grizzly recovery in the North Cascades to help ensure the health of the bears involved in the recovery as well as that of the ecosystem.

Wilderness Watch suggestions include:

\*Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

\*Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. Bears involved in the recovery should not be considered as experimental pawns whose lives are considered expendable during an experimental introduction period, but as the Endangered Species that they are. Which leads to the following point below:

\*Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could voluntarily move across the border without getting killed. A natural voluntary recovery via a natural in migration would be more gradual and more sustainable for current wildlife residing in the designated recovery area including black bear populations as well as the new grizzlies via their natural in migration.

\*Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: These are comments on the plan to recover the grizzly species in the North Cascades.

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem in order to move them to the North Cascades. Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose the notion of an "experimental" designation for any bear population. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a heading, individual bears from the NCDE, which are currently protected under the Endangered Species Act, would be taken from their home range and transported to Washington State, where they would lose their protections under the ESA.

Please, analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. They would also identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Please, develop an alternative that doesn't violate the Wilderness Act or entail heavy-handed, stressful management of bears. Should the NPS choose to translocate grizzlies, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for considering my point of view.

Correspondence: Dear National Park Service,

After H. sapiens have exterminated most other species, your current role is to protect the remaining fellow animals from extinction and not interfere with their location, habits, lifestyle also.

Let them be in their habitat and protect it from H. sapiens. Because the Planet belongs to the future generations of all animals, including H. sapiens, except those who bully others. Thank you.

And with best wishes and kind regards  
I remain faithfully yours

  
formerly post-doc of Johns Hopkins in Human Genetics, currently grandparent of three boys, 16, 14, 6

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Correspondence: For the benefit of our grizzly populations, analyze a natural recovery alternative. This would involve working with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. And, regardless of the details, ensure that the recovery plan does not violate the Wilderness Act!!

Thank you.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: I support the recovery of grizzly bears and other native species where suitable habitat exists. But recovery efforts must meet the requirements of the Wilderness Act. Heavy-handed management would not only be detrimental to Wilderness, but to bears as well. If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies.

Thank you for your time and consideration in this urgent matter.

Correspondence: The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Please put nature and people first.

Thank you for your time and consideration.

Kind regards,

Correspondence: While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways. The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

The recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be

injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population.

Correspondence: Hello; my preference is to be as non intrusive as possible by working with British Columbia for the overall protection of the Grizzlies. Let nature be and let the Grizzlies use natural recovery without people moving the bears about and disrupting a well evolved natural selection. The Grizzlies were there first. They have a long history of self management that is more nuanced than anything people can work out for them. Respecting the wilderness act and allowing for natural recovery makes sense even if the pace is slower. Surely British Columbia can see this value as well. Borders only set up false situation when nature is involved. Intact tracts of land are truly important for the Grizzlies and other species. Please think long term and set a good example of US - Canadian cooperation. [REDACTED]

Correspondence: I am in favor of grizzly bears living in the North Cascades Ecosystem (NCE) in Washington State. It is a perfect place for grizzly bears - the rugged North Cascades are historic grizzly bear habitat, are wild, and have space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. However, I have issues with many of the aspects of your proposed plan.

I oppose any activities that violate the Wilderness Act. It would be stressful for the animals living in this wild area as well as the animals being translocated - no helicopters, no motorized equipment, no invasive monitoring, and no heavy-handed, stressful management of bears.

I believe reintroducing grizzly bears to the NCE would ultimately be more successful if the bears were allowed to find their own way into the area. I would encourage the FWS and NPS to work actively with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border, identifying and protecting corridors and connectivity so that bears could move across the border without getting killed.

I understand that one of the aspects of this plan is to designate the new grizzly population as an "experimental population". This is utterly illogical as bears in an "experimental population" would not be protected under the Endangered Species Act. If the intent is truly to allow bears to live in this area, why would you intentionally remove protected status from bears that are currently protected?

I am not in favor of translocating bears, but if that is the alternative chosen there are some important considerations:

- Grizzlies should not be captured in the North Continental Divide Ecosystem (NCDE) as grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Removing bears from the NCDE would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
- In order not to violate the Wilderness Act, translocation should be limited to sites outside of Wilderness.

Thank you for your consideration of my comments.

Correspondence: Please give your consideration to the following points. They were assembled by people with more knowledge and experience than my own, but I have reviewed them carefully, and I support them as the kind of stewardship of bears that they, and their ecosystems deserve.

- Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
- Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
- Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. \
- Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

Correspondence: Dear National Park Service,

I am writing, due to my concern for the proposed plan, for Grisly Bears.

The bears should not be relocated.

The natural habitat of the bears, should be left alone, for bears to reproduce, and live without interference from humans

The Wilderness Act should be adhered to, and enforced at all times.

Alternative plans, methods of capturing, and altering locations of bears habitats, is destructive and highly detrimental to bears well being.

Relocation methods, are harmful and could cause injuries, besides separating family groups.

The bears in question, should be kept, at all times, under the endangered species act.

There should be constant protections in place always.

Bears are not food, and no one wants to wear bear fur in 2022.

Trophy hunting bears with dogs, and sky war equipment, is cruel and a horrible sport.

Baiting bear dens for an easy murder, is also another atrocity that should be outlawed.

Trophy hunters that kill bears, inside their dens for hibernation, should go straight to jail, for this outrage.

The bears should be admired for their survival

skills, and left alone, to have a life.

Please protect the bears, and stop interfering, in the course of nature.

Intelligent, and highly attuned humans, existing on a higher realm, respect animal life, and do not want to murder animals, for fun or sport

The National Park Service, is funded by the citizens of America, and we want the bears under protection. .

Correspondence: I previously sent comments on the proposed introduction of grizzlies to the North Cascades Ecosystem (NCE). However, I have become aware of a couple of additional issues I would like to address.

First, apparently there are not sufficient grizzlies in the North Continental Divide Ecosystem (NCDE) to support removal of some to the NCE. Therefore, I recommend that bears be taken from BC, which apparently has more grizzlies to spare. I do not want to see the successful re-population of the NCDE with grizzlies be threatened by removing any individuals too soon.

Second, it is very important to me that both the letter and spirit of the Wilderness Act be upheld at ALL times, including during reintroduction efforts. That means ZERO motor vehicles or equipment, including helicopters, within designated Wilderness. From a practical standpoint, it probably means translocating the bears into non-Wilderness lands, where motorized equipment CAN be legally used. And it means doing any follow-up monitoring by non-motorized methods. It's just NOT okay to fly helicopters into or over any Wilderness, at ANY time, for ANY purpose. It is forbidden by law, and it violates the spirit of the world's most forward-thinking law, the 1964 Wilderness Act. I do not, however, object to the use of radio collars to track the movements of introduced bears, as long as the radio receiver is carried by hand into Wilderness.

I recognize that release of bears into non-Wilderness areas MAY increase the chances of conflicts with humans, their property and activities. Therefore, it becomes all the more important to MAINTAIN ESA protections for the translocated bears, so they are not killed by humans.

We are talking here of protecting and encouraging TWO vital resources/values. One is the grizzly, and the other is capital W Wilderness. We cannot sacrifice one to benefit the other.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Correspondence: I Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities.

It's also questionable whether a translocation plan will be successful without Canadian support.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies

Correspondence: I am writing in favor of grizzly bear recovery in the Northern Cascades. I am a wildlife conservationist and there are multiple reasons to support translocating grizzlies back into the ecosystem they lived prior to being hunted to extirpation. For example:

- Grizzlies will provide ecological benefits in the North Cascades, like seed distribution and soil aeration
- Righting the wrong of hunting bears into extirpation many years ago
- Grizzlies are culturally important to Indigenous people in our region

Thank you for your consideration.

Correspondence: I strongly oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. Grizzlies have still not recovered in the NCDE and there are no "extra" bears there to move to Washington. This plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone. It's bad science.

I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

I support a natural recovery alternative--please analyze this option. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. This is the best bet for bears.

I also support an alternative that doesn't violate the Wilderness Act--this is a no-brainer--why would we want to violate this landmark legislation? Alternatives that would violate the Wilderness Act entail heavy-handed, stressful management of bears--why do this? If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you in advance for your attention, and for your work on behalf of our wilderness.

Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I am writing to encourage the NPS and FWS agencies to reconsider their approach to grizzly recovery in the North Cascades.

In particular they should:

1) Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

2) Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

3) Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

4) Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence:	MOTHER NATURE WILL ALWAYS BE THE BEST STEWARD OF THE WILDERNESSES AND WILDLIFE. PLEASE LET THE RECOVERY DEVELOP NATURALLY.

I strenuously oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park and move them to o the North Cascades is not sustainable. The grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington ! Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I deeply oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Correspondence: The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be

injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Please write to the National Park Service by December 14 and encourage the agencies to reconsider their approach to grizzly recovery in the North Cascades.

Some points to emphasize (please use your own words if possible):

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS

choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I support reintroduction of grizzly bears under 10j where forest landowners can support robust and sustainable populations of bears, but landowners would not face inappropriate restrictions or takings of state or private properties. The North Cascades are large enough and remote enough bears and people can coexist. My life and that of others in the PNW will be richer for having healthy grizzly populations here. Ship in some healthy sows and a few boars.

Correspondence: Take Action--Help improve grizzly recovery plan for the North Cascades

[REDACTED]

North Cascades  
Comments Needed on Plan to Recover Grizzlies in North Cascades

The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act.

Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Please write to the National Park Service by December 14 and encourage the agencies to reconsider their approach to grizzly recovery in the North Cascades.

Correspondence: I support protecting wildlife, especially wildlife that is endangered and want to see Grizzly Bears protected. Therefore, I OPPOSE the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I OPPOSE an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Regarding the idea of to analyze a natural recovery alternative, well this is NOT the same as the NO Action alternative. Under a NATURAL RECOVERY alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

I would prefer that you would develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for protecting Grizzle Bears and their habitat.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: As an environmentally motivated voter and a native and current Washingtonian, I strongly support the development of a grizzly bear population in the Cascades Wilderness. However, there is a much better plan for achieving this goal than the one currently being proposed by the National Park Service. Instead of its invasive and wilderness-disturbing methods of bringing bears to the wilderness area and its designation for bears that strips them of endangered species protections, a plan that will allow bears to naturally return to their former territory and that will use non-intrusive methods of collecting data on them is far superior and will preserve the wilderness characteristics of the territory for the bears and all the other species that live there.

Correspondence: To Whom it may Concern:

I am writing to express my concerns about the grizzly recovery plan for the North Cascades.

As you are aware, the federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

I urge you to analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

It is vital to develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears.

Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness.

Thank you for your attention to this matter.

Correspondence: Dear National Park Service,

I so dearly love our national forests; they are treasures! I also value the animals who live there, including grizzly bears! Please consider the following additions to your plans:

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation.

The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Allow grizzlies a natural recovery rather than yanking them out of their ancestral habitat in Canada.

Natural recovery includes banning poaching and hunting with strict enforcement and penalties to discourage the gun-ho types from killing grizzlies.

Keep wilderness wilderness: Ban the use of internal combustion terrestrial and aerial vehicles. Eliminate applications of biocides and the culling of species not in favor with agencies or people.

Limit (better yet for the bears, ban) physical interference with grizzlies: Chasing with vehicles, darting, drawing blood, collaring and other manipulations stresses bears and can even kill them.

Make wildlife corridors between Canada and the US generous in size and protected from men with guns.

Correspondence: Dear Sir or Madam,

We oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The feds are planning to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to take them to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "additional" bears there that could be brought to Washington. Such a plan would weaken the NCDE grizzly population and reduce the likelihood that the necessary population links between NCDE grizzlies and grizzlies will develop elsewhere, such as Yellowstone.

We oppose the designation of an "experimental population". The authorities must develop and analyse an alternative that is not based on the designation of a so-called "experimental" population. Such a designation would remove individual bears from NCDE - currently protected under the Endangered Species Act - from their home range and move them to Washington State, where they would lose their protection under the ESA.

Analyze an alternative to natural recovery. This is NOT the same as the No Action alternative. Under natural recovery, the FWS and NPS would actively work with British Columbia agencies to ensure grizzlies are protected on both sides of the border. Under this alternative, authorities would identify and protect corridors and connecting trails to allow bears to cross the border without being killed.

Develop an alternative that does not violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and result in cumbersome, stressful bear management. Should the NPS choose to relocate bears, the agency should first consider limiting relocation to areas outside of Wilderness. Should the NPS choose to relocate bears within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorised equipment and no invasive monitoring.

We thank you!

Yours sincerely

Correspondence: I support the recovery of grizzly bears and other native species where suitable habitat exists. But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without

trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

What's more, the proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Because of this, I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) must analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) must also develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.  
Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.  
Thank you!

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Correspondence: I want to take this opportunity to let you know that I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem from British Columbia or the Northern Continental Divide Ecosystem (NCDE). Grizzlies still have not recovered in the NCDE, prevent weakening the NCDE grizzly population.

Furthermore: agencies must create an alternative that does not rely on the so-called "experimental" population designation, meaning that currently protected individual bears from the NCDE would be transported to Washington state, losing their protections under the ESA.

Applying a natural recovery alternative means that the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border.

Correspondence: The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Correspondence: To National Park Service,  
I understand the need to increase the grizzly bear population as well as expand and diversify its living area. There are many things that need to be considered and studied scientifically before making a decision.

Therefore I would like to express my opposition the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery

alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Finally, please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

It is important to protect and help the grizzly population grow.

Thank you!

Correspondence: Please reconsider your approach towards grizzly recovery in the North Cascades.

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. Taking bears from the NCDE, which has yet to recover, would prove detrimental to the grizzly bears in that region. Allow them time to build up their population before removing them.

Please protect our bears! Relocating bears from NCDE to the North Cascades would cause these grizzlies to lose their protection under the endangered species act. Do not move grizzlies to the North Cascades!

Please consider a natural recovery alternative. Please allow the FWS and NPS to work with agencies in British Columbia to protect and monitor grizzly bears in this area on both sides of the border. By doing so, the agencies can track the bears moving through these corridors and avoid them being killed.

Please reconsider your stance and help protect out grizzlies!  
Thank you

Correspondence: I am commenting to express my strong objection to the proposed bear hunt. Bear hunts do not reduce human-bear conflict, and are no more than trophy hunts, spilling blood of innocent creatures for pleasure. It is possible to live in harmony and co-exist peacefully with bears, and that calls for more effective trash management, and bear-smart policies, not more killing.

Protect bears and all non-human animals from human abusers.

Correspondence: The grizzlies need to be protected. Why would any person in their right mind kill an innocent animal for NO REASON!!! Find something else to do with your useless life. Get a real job. You want to kill a living

thing? There are millions of HUMAN violent criminals all over our streets thanks to this Biden administration. He is letting criminals run wild, and immigrants and terrorists in our country to destroy it. Grizzlies are not a problem, Biden administration is.

Correspondence: • Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

• Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

• Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

• Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Dear Sirs:

I respectfully request that you consider the following comments and suggestions that I personally wholeheartedly support and recommend:

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Sincerely,

---

Correspondence: If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

It means rejecting an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. I urge you to analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

It means developing an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for considering my comments.

Correspondence: If it is decided that wild Grizzlies must be captured for release in the North Cascades we must ensure they are not stolen from the as yet unrecovered Grizzly populations of the Northern Continental Divide Ecosystem or adjacent residents of British Columbia. We must not degrade one habitat to restore another. In fact, any viable population to exist in the North Cascades will be totally dependent on the genetic diversity available through wild corridors to distant populations such as these.

If any Grizzlies are to be translocated to the North Cascades it should be on lands not designated as Wilderness. If you are to translocate Grizzly bears into Wilderness areas it must be done according to regulations under the Wilderness Act. This means no helicopter flights or use of motorized vehicles. It is obvious that over management would be counter productive to the recovery of a viable Grizzly population. We must not dart/drug, tag/collar, and handle wild Grizzlies! If Grizzlies are to be constantly monitored in Wilderness, then it must be done on foot without mechanical disruption.

Grizzlies must not be stripped of their protections, currently afforded them under the Endangered Species Act. An "experimental population" designation would put any Grizzly bears found in the North Cascades under jurisdiction for legal slaughter.

A Natural Recovery Alternative must be considered, as opposed to a "No Action" alternative. The best option for a sustainable reintroduction of any species is to allow them to rehabilitate potential/previous habitat of their own volition, if at all possible. In this case the NPS & FWS could co-manage with local authorities in British Columbia to ensure no Grizzlies are killed, that they might freely cross the border. Rather than risking the slaughter of returning bears, we can designate & protect wildlife corridors thus ensuring population connectivity in perpetuity. Though it would take longer than the immediate gratification of releasing

Grizzlies into the North Cascades ecosystem, any bears that arrive by their own efforts will be far better suited to make a go in their historic range.

Thank you for your attention

Correspondence: Please reconsider your approach to grizzly recovery in the North Cascades. I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. I oppose an "experimental population" designation, which would result in the bears losing their protections under the ESA.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Please develop an alternative that doesn't violate the Wilderness Act. Thank you.

Correspondence: The first thing that has to be looked at, in the reintroducing of Grizzly Bears, is why they have disappeared and have to be reintroduced. I remember the reintroducing of Wolf program, where years later States are killing off Wolves once again because the Farmers, people moving into their territory, and Cattle industry is being allowed to graze their cattle on government and public property, and there were no protections to restore the balance of nature by making it illegal to kill Wolves and Bears.

The same fate awaits the Grizzly Bear population, Grizzlies need a lot of land to roam in, and use for their territories, Grizzlies are loners and will not tolerate other Bears, or sometimes people in their territory. What is needed is for large parts of the country to be set aside as Wilderness areas, to protect wildlife, and the practice of allowing people to go hiking and camping in Grizzly Bear territory in Wilderness areas, needs to be prohibited. All so if people decide to go hiking in grizzly or any Bear habitat and they encounter a bear get mauled or killed, it is because the bear is protecting it's territory and or cubs, Bears don't hunt and kill people as a normal practice and the Fish and Game Departments and rangers, need to stop going out and killing any bear the harms a human.

Correspondence: Hello, I'm writing to submit comments on the plan to recover Grizzlies in the North Cascades. The National Park Service and the U.S. Fish and Wildlife Service plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington is misguided and inappropriate. .

The initial plan would degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem around Glacier National Park, and strip the individual grizzlies of their current

protections under the Endangered Species Act.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under the U.S. Endangered Species Act. Under this designation, the bears would lose their current protections under the ESA and could be shot, re-captured, or killed in the North Cascades.

Recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you,

██████████

Correspondence: Please do not capture grizzlies from the Northern Continental Divide Ecosystem. The area is what's left of their much larger roaming territory, and we can't have healthy ecosystems in Canada nor in the US without grizzlies.

No to experimental population designation for bears. As soon as moved to Washington state they quit being protected by ESA regulation. You know that, so don't do it..

Work with British Columbia authorities to agree on a way to allow bears pass the Canadian border to the US back and forth.

Most importantly: It's not acceptable to have special agencies to protect wildlife if all these agencies are just for kidnapping, trapping or killing bears. We need scientific humane solutions, not decimation of bear the population.

A Better way,  
A natrual recovery Alternative you must stringently follow the Wilderness Act and Endangered Species Act .Thus complying with No helicopters, motorized vehicles and equipment and NO INVASIVE monitoring.  
It is Crucial you swiftly move to strengthen, adopt, and implement policies and strategies. Its Imperative you create stronger laws and policies to Preserve and Protect our environment and its non human inhabitants. These protections must be fiercely established and enforced due to human ignorance, greed and destruction.  
Respectfully,

---

Correspondence: Regarding your Grizzly Bear Recovery Plan for the North Cascades, I support recovery but with these caveats:

1. Any actions should not violate the spirit of the Wilderness Act. I oppose using mechanical means such as helicopters within designated Wilderness Areas.

2. I am concerned that bears will be taken from the Northern Continental Divide Ecosystem when bears are not fully recovered from that area. How will removing bears from this area impact their full recovery across their range, including connecting populations that are now disparate such as connecting with populations in the Greater Yellowstone Ecosystem?

3. I would like to see an alternative explored that would promote the natural expansion of the grizzly bear range into the Cascades by instituting natural corridors and other means.

Thank you for consideration of my opinions and concerns.

Correspondence: This issue is so critical because it has far reaching ramifications for the wilderness and wildlife.

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem and you should too. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Please analyze, and choose, a natural recovery alternative. This is NOT the same as the "No Action" alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

This should be at the top of your requirements: Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring!

North Cascades  
Comments Needed on Plan to Recover Grizzlies in North Cascades

The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on

and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Please reconsider your approach to grizzly recovery in the North Cascades.

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

You should analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

The agencies should develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence:	I will be looking for the EIS to address the danger of human/bear interaction in times of adverse weather, as when drought or unseasonal snows reduce forage, or when wildfire drives bears into unusual areas.

Long-run sustainability of bear populations in the North Cascades depends on effective protection of humans in the adjacent settled areas. It is critical that the EIS give adequate weight to that concern.

Correspondence: As someone who has seen grizzlies in the wild, I support the restoration of grizzlies to the North Cascades, but only if it is done right, The National Park Service and Fish and Wildlife Service proposal does NOT do it right.

I oppose the kidnapping of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose the proposed ESA 10(j) "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. These bears could then be moved, shot, or killed. This is totally unacceptable.

The agencies MUST analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. Even transplanted grizzlies will not survive in the North Cascades in the long run if this work does not occur.

The agencies MUST develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: To Whom It May Concern:

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies' plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Instead, I urge you to analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

In addition, I am supportive of developing an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your time and consideration!

Correspondence: Although I support the recovery of grizzly bears and other native species where suitable habitat exists, there are problems with the plan. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we

take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers and would degrade the Wildernesses involved.

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS

choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Please reconsider your approach to grizzly recovery in the North Cascades.

I would like to suggest the following:

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. Grizzlies have still not recovered in the Northern Continental Divide Ecosystem (NCDE), and there are no "extra" bears there to move to Washington.

Oppose an "experimental population" designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Develop an alternative that doesn't violate the Wilderness Act. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Alternatively, let nature take its course. Do not relocate any grizzlies thus avoiding the stress, risk and inadvertent mistakes that will most likely occur.

Sincerely,

[REDACTED]

Correspondence Type: Web Form  
Correspondence: Good morning, below are my comments on your plan to recover grizzly bears to the northern cascades.

1) I oppose capturing of grizzlies from the North continental divide area. Plans to "kidnap" bears from the delicate ecosystem and move to the northern cascades would weaken the current grizzly population, and it's not as if there are "extra" bears to move. This would also negatively impact grizzly population development in other areas, such as Yellowstone.

2) I oppose designating individual bears as an experimental population. These bears are already protected under the Endangers Species Act and taking them from their home range to be transported to Washington state would make them lose their protected species under the ESA.

3) Please analyze a natural recovery alternative. This plan would assure that both USA and Canada would work together to ensure that grizzlies are protected on either side of the borders, so the bears can move freely between borders without getting killed.

4) Whatever the alternative that is decided upon, it must not violate the Wilderness Act. Handling the bears is very stressful, and relocating them is extra stressful. Please comply with the letter and spirit of the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for considering my comments which are being sent in the spirit of keeping the wilderness wild and unencumbered by humans.

Correspondence Type: Web Form  
Correspondence: Dear NPS:

I respectfully request that you reconsider your approach to grizzly bear recovery in the North Cascades. I wish to offer the following comments during this initial scoping period and ask that you consider them in improving the tentative plan:

1. I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to translocate bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier NP to move to the North Cascades. Grizzlies have still not fully recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
2. I oppose an "experimental population" designation. The agencies should create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
3. Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
4. Develop an alternative that doesn't violate the Wilderness Act. The agencies should not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your consideration.

Correspondence: The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

Please write to the National Park Service by December 14 and encourage the agencies to reconsider their approach to grizzly recovery in the North Cascades.

Submit comments online:

<https://parkplanning.nps.gov/commentForm.cfm?documentID=124399>

Some points to emphasize (please use your own words if possible):

- Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
- Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
- Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
- Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no

motorized equipment, and no invasive monitoring.  
Thank you!

### Comments Needed on Plan to Recover Grizzlies in North Cascades

The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is

lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears. The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Please write to the National Park Service by December 14 and encourage the agencies to reconsider their approach to grizzly recovery in the North Cascades.

Some points to emphasize (please use your own words if possible):

- Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
- Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
- Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
- Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: I strongly applaud the National Park Service and Fish and Wildlife Service for attempting to bolster grizzly bear populations in Washington state in the North Cascades Ecosystem. It's excellent that these agencies realize and act upon the need for more grizzlies in that area.

The proposed plan, however, would leave the relocated grizzly bears vulnerable to hunting, poaching, etc, because they would be listed as an "experimental population," thereby voiding any protections the bears would have under the Endangered Species Act. Altering the plan to allow for the relocated bears to keep ESA protections is crucial.

The bears slated for relocation all come from the Northern Continental Divide Ecosystem, a place that grizzly bear populations still haven't saturated yet. The bears that live in the NCDE should be left there to repopulate and alternate populations of grizzly bears (from places where they can safely be taken from without harming the burgeoning population) should be considered.

A Natural Recovery alternative would be best, as this would entail the NPS and FWS work in conjunction with British Columbia and other parts of Canada to ensure that grizzlies are given the best chance of survival, the best protections under the two countries laws, and given appropriate habitat corridors. It would also ensure that no one could kill a grizzly bear, no matter where the bear wandered (parks, wilderness, public or private land). This would not be a No Action alternative; a Natural Recovery alternative would be a farther reaching and more erudite plan.

Thank you,

---

But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence:	Gentlemen,

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies involved must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

The analyze a natural recovery alternative is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

An alternative that doesn't violate the Wilderness Act needs to be developed. The agencies involved must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. Laws should be enacted to insure the safety of the bears - ie. no hunting until a successful viable and reproducing population has been established,

Thank you!

Sincerely,

---

Correspondence Type: Web Form  
Correspondence: These are my comments on grizzly relocation from the Northern Continental Divide  
Ecosystem: don't do it!

I am opposed to the capture of grizzlies from the Northern Continental Divide Ecosystem because it doesn't make sense and would be detrimental to grizzlies.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered there, and there are no "extra" bears to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also urge you to oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

I urge you to analyze a natural recovery alternative, but this is not the same as the No Action alternative!!

Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

I also urge you to formulate an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your consideration.

Correspondence: After reading many of the objections to your grizzly bear reintroduction to the Northern Cascades, I must agree with the naysayers. There are no extra bears to be gotten from the areas that you plan to take them from, leaving those areas lacking. Also, if brought from their home territories, they will have no endangered species protection. So that our blood lust happy gun toters can kill them with abandon.

I believe your administration needs to rethink how this plan would move forward keeping the Wilderness Act in the forefront of those considerations.

Correspondence: I the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem

(NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Also develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: I am writing today to recommend for the improvement of the grizzly bear plan in the North Cascades. I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades is misguided. Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

I would like to recommend an analysis for a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Finally, I would like to recommend that an alternative that doesn't violate the Wilderness Act is developed. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your time and for your consideration.

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies' plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades is not sound. Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone. There should be another way that doesn't require relocation from delicate populations.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. The grizzlies need to maintain their status. If anything is clear, it's that reintroductions absent protections or once they lose protections start to fail.

Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. Additionally, bears could be moved from areas where they are not under protections.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS

choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopter and, no motorized equipment.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: I am writing to express my conditional support of the plan to introduce grizzlies into the area around the North Cascades. I would support this plan but only if the plan did not capture the grizzlies from the Northern Continental Divide Ecosystem. As it stands now in the plan, the federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades; this however is not a good idea and should not be pursued since grizzlies have still not recovered in the NCDE, so there are no bears not needed there which could be relocated to Washington. Indeed if pursued this plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also am very concerned by the plan to designate the relocated bears as an "experimental population", since this designation would cause the relocated bears to lose their protections under the ESA. Therefore I would urge that this designation not be used, and an alternative be used, whereby the bears would retain their protections under the ESA.

I also urge that the FWS and the NPS analyze and develop and commit to a natural recovery alternative for these bears. Unlike the No Action alternative, a natural recovery alternative would direct the FWS and NPS to work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Finally I would like to urge the development of and commitment to an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act; this means that the agencies would not rely on or use heavy-handed, polluting, noisy and highly stressful approaches to

transporting and managing the relocation of bears. Should the NPS choose to re-locate bears, the agency should first limit translocation to sites outside of Wilderness, and should the NPS decide to translocate the bears within Wilderness, the agency must commit to complying in full with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

I hope that you will take these provisos into consideration and thank you.

Correspondence: The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. Animals were put on this earth to learn from and co-living with them. people need to give them space just like they give people space. we need to learn about them not destroy them or where they live cause of stupidity and fear of the unknown!!

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: I am a watershed ecologist who understands the importance of fully functioning ecosystems to our climate, water quality, air quality, quality of life, and overall well being.

Grizzly bears lived in the North Cascades for thousands of years, and they belong here. They play a key ecological role as a native keystone species in the North Cascades. For example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. In addition, Grizzly bears are culturally important to many Native American tribes and First Nations.

People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and in the North Cascades can, too.

There are only a few places left where grizzly bears can exist, and the North Cascades is one of them. I fully support reintroducing grizzly bears in the North Cascades!

Correspondence: Hello  
I ask that the National Park Service reconsider its grizzly recovery plan in the North Cascades.

The NCDE does not currently have a grizzly population adequate to support removing any individuals for relocation to Washington state.

Please develop and implement a natural recovery plan, establishing and protecting corridors for the bears to move back and forth without threat of being killed.  
Your plan must not violate the Wilderness Act.

Thank you

Correspondence: Hi. Grizzly bears play a key ecological role as a native keystone species in the North Cascades. There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears.

This can happen in the North Cascades, too.

Correspondence: • Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
• Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
• Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.  
• Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Re-introduction of Grizzly Bears into the North Cascades ecosystem of northern Washington State is fantastic!!

As you surely know, Grizzlies were once numerous in the North Cascades, but fur traders and settlers killed thousands of them and drove them to the brink of extinction. The last documented grizzly bear in the North

Cascades was killed in 1967, and the last confirmed sighting of a grizzly was in 1996. That is a tragedy for the species and the American people.

Thank you for taking such an important step in re-introducing into their original habitats this species. Hopefully, other decimated populations of wildlife and flora/fauna can also be re-introduced into their native habitats.

Keep up the good work and thank you!

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: It is essential for our planet's future that we re-introduce grizzly bears into the North Cascades. Grizzly bears lived in the North Cascades for thousands of years, and they belong here. Over the years, they were hunted to extinction in this range, and prevented from re-entering due to fractured land areas and impediments to travel due to structural changes brought about by human building developments.

I want to help chart a new future where we coexist with grizzly bears.

Grizzly bears play a key ecological role as a native keystone species in the North Cascades, meaning that they are essential for the natural balance and health of this ecosystems.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: I support the reintroduction of grizzly bears to the North Cascades wilderness area, to keep the ecology in balance. Care should be taken to make sure the reintroduction will not unduly endanger people. If there are any ranches or farms in our near the area, help should be offered to help them protect their livestock and themselves from grizzlies, such as funding to obtain specialized breeds of dogs that are known to protect livestock and people from large predators such as bears and wolves. There should also be a fund to compensate farmers/ranchers if despite such efforts the grizzlies are still able to kill some of the livestock or injure them. Care should also be taken to educate the general public on how to avoid aggravating grizzlies, how to avoid getting attacked by one, and how to increase one's chances for survival if despite all precautions one is attacked by a grizzly .

Correspondence: I Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. Kidnapping bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park and moving them to the North Cascades is not in the bears best interest. Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Individual bears from the NCDE are currently protected under the Endangered Species Act. Should these protected Grizzlies be taken from their home range and transported to Washington state, they would lose their protections under the ESA.

I support a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect

corridors and connectivity so that bears could move across the border without getting killed.

I also support the development of an alternative that doesn't violate the Wilderness Act. The FWS and the NPS agencies must not pursue alternatives that would violate the Wilderness Act and would entail stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for the opportunity to encourage reconsideration of the current grizzly recovery program in the North Cascades.

Correspondence: The North Cascades ecosystem is one of the only viable areas left in the west for Grizzly bear recovery, and would benefit greatly from their ecosystem services. Recovery was recommended decades ago, but has been blocked too many times by special interest groups. The majority of people in Washington want Grizzlies back in the North Cascades, and the area is overwhelmingly public land, including North Cascades National Park, and multiple wilderness areas. Recovery areas in Wyoming and Montana have shown humans can coexist with Grizzlies in the lower 48 if given enough space, and there's plenty of space and habitat in the North Cascades. Don't give in to the pressures of the ranching community again. They are a small percent of Washington, and especially the counties within the recovery zone. After several decades it's time to finally return Grizzlies, the emblem of western wilderness, back to some of their original habitat in Washington state.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

2) Oppose an "experimental population" designation. The agencies must create and analyze an alternative that

does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

3) Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

4) Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you.

Correspondence:	Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence:	At 75 my time on earth is limited. I have enjoyed watching a lot of wild life and would like my grandchildren and their children to do the same. The Sierra club brought to my attention the plight of the Grizzly Bear in the Pacific Northwest I would appreciate your attention to their plight and possibility for restoration.

I understand that:

Grizzly bears lived in the North Cascades for thousands of years, and they belong here.

I want to help chart a new future where we coexist with grizzly bears

Grizzly bears play a key ecological role as a native keystone species in the North Cascades

I want to pass down a wild landscape to future generations that includes all native species, including the grizzly. Grizzly bears are culturally important to many Native American tribes and First Nations People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades. There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

Please consider restoration..

Thank you, [REDACTED]

Correspondence: The North Cascades ecosystem is one of the only viable areas left in the west for Grizzly bear recovery, and would benefit greatly from their ecosystem services. Recovery was recommended decades ago, but has been blocked too many times by special interest groups. The majority of people in Washington want Grizzlies back in the North Cascades, and the area is overwhelmingly public land, including North Cascades National Park, and multiple wilderness areas. Recovery areas in Wyoming and Montana have shown humans can coexist with Grizzlies in the lower 48 if given enough space, and there's plenty of space and habitat in the North Cascades. Don't give in to the pressures of the ranching community again. They are a small percent of Washington, and especially the counties within the recovery zone. After several decades it's time to finally return Grizzlies, the emblem of western wilderness, back to some of their original habitat in Washington state.

Correspondence: I am writing to support the reintroduction of grizzly bears to the North Cascades region. Humans (Americans have had a dramatic impact on the bears that once inhabited this area and it is right and proper we try to restore grizzly bears to this region. The North Cascades is one of only a few places where grizzly bears can exist. People around Yellowstone Park co-exist with grizzly bears and it can be done in the North Cascades too.

There are also human cultural reasons to restore grizzly bears to this area. One reason is that I understand grizzly bears are culturally important to many Native American tribes and First Nations. Two is that it is important to preserve and protect wild landscapes for future generations that includes all native species, including the grizzly.

Thank you for considering my request.

Correspondence: I oppose the federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Please consider a natural recovery alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

I therefore oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Correspondence Type: Web Form  
Correspondence: Dear Sirs,

Recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Thank you,

---

Correspondence: Dear NPS:

I am writing to you today because I enjoy watching wildlife, I visit the Park, and enjoy related outdoor activities.

Grizzly bears lived in the North Cascades for thousands of years, and they belong here. I want to help chart a new future where we coexist with grizzly bears

Grizzly bears play a key ecological role as a native keystone species in the North Cascades. I want to pass down a wild landscape to future generations that includes all native species, including the grizzly.

Grizzly bears are culturally important to many Native American tribes and First Nations. People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades.

There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

Thank you for your thoughtful, humane and compassionate consideration of my request.

Sincerely,

██████████

Correspondence: To Whom It May Concern:

I am writing to oppose the capture of grizzlies from the Northern Continental Divide Ecosystem (NCDE) because this would be detrimental to the species' recovery. Grizzlies still have not recovered in the NCDE, and this plan would weaken the NCDE grizzly population and diminish the likelihood of linking the NCDE grizzlies with populations elsewhere, such as in Yellowstone.

I also want to voice opposition to the idea of an "experimental population" designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

It would be better to analyze a natural recovery alternative, which is different from a No Action alternative. In a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border and would identify and protect corridors and connectivity so that bears could move across the border without the possibility of getting killed.

It also is necessary to develop an alternative that doesn't violate the Wilderness Act, which means no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your time and consideration.

Correspondence:	Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence:	Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home

range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I am writing in support of reintroducing grizzly bears to the North Cascades. Every species has its place and purpose in the ecosystem, and bears were once part of the North Cascades. While animals will migrate to try to establish or reestablish territory, this has become increasingly difficult with the fragmentation of habitat by roads and development. It would be wonderful to see a population of grizzly bears reintroduced to a place where they were wiped out.

Correspondence: Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too.

That is why I support the National Park Service and Fish and Wildlife Service reintroducing grizzly bears to the North Cascades!

Correspondence: Dear Sir or Madam,

This country's unique wild places and ecosystems need help. Our native species are threatened by development, oil and gas exploration, and climate change. I want these places and species around for my kids, and their kids.

I love the Pacific Northwest, a region of uncommon beauty and priceless biodiversity. Grizzly bears lived in the North Cascades for thousands of years, and they belong here. Please help chart a new future where we coexist with grizzly bears, which play a key ecological role as a native keystone species in the North Cascades

People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades.

There are only a few places left where grizzly bears can exist, and the North Cascades is one of them. Please help repopulate this region with this keystone animal.

Thanks,

Correspondence: Hello,

I am writing to encourage the reintroduction of Grizzly Bears to the North Cascades, where they had existed for thousands of years, before being killed and driven out by humans. Grizzly reintroduction has been successful in the Rocky Mountains, where people and bears have been able to coexist, and there's no reason why this can't be done in the Cascades, as well. As an apex predator, Grizzlies play an important ecological role as a native keystone species. In addition, Grizzlies are important to many Native American tribes and First Nations. The North Cascades provides one of the very few habitats left where they can exist.

I want future generations to be able to enjoy wild landscapes with their flora and fauna, as they should be, before we drive the Grizzly and other species extinct. If the people in Yellowstone and the northern Rockies can live, work and recreate alongside grizzly bears, then so can those that live in or visit the North Cascades.

Thank you,

██████

P.S. I request that my personal information be withheld from public view. Your warning that you can't guarantee it will be, seems like a ploy to discourage participation in the comment process.

Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

• Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too. Thank you.

Correspondence: I would like to make the following comments regarding the proposed plan:

- I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
- I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
- I support a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
- Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no

motorized equipment, and no invasive monitoring.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: I support the reinstatement of grizzly bears into the North Cascades for many reasons. As a parent and grandparent, I want my family and future generations to be able to study and enjoy a wild landscape and benefit from the ecological role grizzly bears play in keeping not only their habitat, but our planet, healthy. Native Americans have cultural ties to these majestic animals. The North Cascades remains one of the few places left where grizzly bears can live. They live among people in the Rocky Mountains and can do so again in the North Cascades.

Correspondence: If reintroducing grizzly bears to the North Cascades will do as much for the total ecosystem as the reintroduction of wolves did for Yellowstone, then what are we waiting for. I'm told this is natural habitat for them, maybe not as vast and uninterrupted as in the past, but that it will support some number.

Let's do this for the environment for future generations and Native Americans in the area.

Thank you for your consideration. We're all in this together.

Correspondence: I spend a lot of time in wild places watching and photographing wildlife. Most of my outdoor time is spent near home, but I do get into the northern woods from time to time. Grizzly bears have lived in the North Cascades for thousands of years, and it would be really exciting to see them there the next time I'm up that way. While the presence of grizzly bears increases safety concerns, people in Yellowstone and the northern Rocky Mountains live, work, and recreate in grizzly bear areas, and we can do it in the North Cascades too.

In addition, grizzly bears can play an ecological role as a native keystone species in the North Cascades as they do elsewhere, just as we have seen wolves affect landscapes in the greater Yellowstone area.

Although, not my place to speak for them, but I understand that grizzly bears are culturally important to Native American tribes and First Nations peoples in the northwest. In southern Nevada, we are working to protect and expand access to natural places and natural resources by our local tribes, and I can only imagine the ways in which these cultural issues are important to tribes up north. We should accommodate them.

There are only a few places left where grizzly bears can exist, and the North Cascades is one of them. I want to live in a world and pass down to future generations a wild landscape that includes all native species, including grizzly bears.

Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: We must do whatever we can to restore native habitats, including the grizzlies. Due to a lack of time, I cannot read the documents by Dec 14th, however we must consider

1-Reduce toxic tires, plastics and harmful pesticides that impact our fisheries and hence the grizzlies.

2-Support infill dense city developments and work to stop suburban sprawl which is destroying huge swaths of integral wildland, estuaries, forests, and wetlands and all wildlife that depends on in these wilderness areas in this country. We need to support re-wilding of regions across the USA in order for other species to thrive.

3-We need to prohibit plastics and throw-away products, especially in the parks.

I apologize for the brevity.

Don Striker, Superintendent  
North Cascades National Park

Hugh Morrison, Acting Regional Director  
U.S. Fish & Wildlife Service

RE: 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan  
Scoping Comments for Environmental Impact Statement (EIS)

Electronic comment submission: December 7, 2022

Dear Superintendent Striker and Acting Regional Director Morrison:

Thank you for restarting the process to return grizzly bears to the North Cascades Ecosystem (NCE), some of the

most productive grizzly bear habitat in the world. Thanks also for the opportunity to provide scoping comments on the 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan. My preferred choice, and to me, the only one that will result in a successful restoration outcome, is Alternative B, including the experimental population designation under section 10(j) of the Endangered Species Act (ESA).

After more than three decades protecting, conserving, and improving land and water resources with environmental and coalition nonprofits, I retired in 2019 to spend time with my camera and to explore the wild beauty of the Pacific Northwest (PNW).

A driving force behind my photography was the desire to photograph grizzly and black bears (spirit bears too, but that remains on my wish list) and to learn about and spend time in the presence of this keynote and apex subspecies of the brown bear. I have successfully pursued this dream across Idaho, Wyoming, Montana, British Columbia, and Alaska. The thought that one day I (and my daughter and my recently-arrived granddaughter Daisy) might see, photograph, and spend time with a restored grizzly bear population here in my home state of Washington is exciting and a dream come true.

Grizzly bears are a vital natural and cultural part of the PNW and restoring them would bring an improved and needed balance to the NCE.

As the Public Scoping Materials outline, this decision (EIS) addresses how best to:

- Avoid the permanent loss of grizzly bears in the NCE
- Contribute to the restoration of biodiversity of the ecosystem for the benefit and enjoyment of present and future generations
- Enhance the probability of long-term survival and conservation of grizzly bears within the NCE and thereby contribute to overall grizzly bear recovery
- Support the recovery of the grizzly bear to the point where it can be removed from the Federal List of Threatened and Endangered Wildlife Species Objectives

The only way to successfully reach each of these goals is by implementing Alternative B.

Per the scoping documentation, grizzly bears are effectively expatriated from the NCE with no sightings since 1996. Interagency efforts to restore grizzlies to the NCE dates back to 1997 (longer with the 1991 National Grizzly Bear Recovery Plan and its 1993 revision). Given this more than two decade history of effort, it is evident that Alternative A (No Action), using only existing management practices, will not result in restoration and increased numbers of grizzly in the NCE.

Improved sanitation, poaching control, access management, outreach and educational information programs are all important, but first we must have grizzly bears to learn about and manage. Alternative A is business-as-usual and inadequate for a restoration action. Future research, monitoring for presence, distribution, habitat, and home ranges would be a waste of agency and public resources as almost no bears remain to be studied.

I also support Alternative B as it designates grizzly bears in the U.S. portion of the NCE and surrounding areas as an experimental population under section 10(j) of the ESA.

It is not the process I would prefer, but I understand the need to have options as agencies deal with the return of a predator species, and the need for public information, involvement, and safety. Perhaps more importantly, we need options and regulations to buffer against efforts to stall, overturn, or remove grizzly bears from the NCE in the future. If properly implemented, 10(j) listing for threatened species could provide these benefits to managing agencies.

Alternative elements and Management Tools to be Considered

However, how the 10(j) listing is worded will be critical as 10(j) provides authorities, ranchers, and landowners with more options for managing bears. This is problematic as nearby state governments (including those with grizzly recovery zones), as well as private interests, have a long history of actively working to reduce predator numbers, and kill and trap bears and wolves. One of the current leading causes of death for grizzly bears is conflict with livestock operators and big game hunters <https://www.grizzlytimes.org/problem-killing-bears>. 10(j) language

should firmly lock in NPS and USFWS as sole managers of this recovery effort.

The final EIS (FEIS) must also detail a plan for permanent protection once the designated number of grizzly bears return. A future certainty for grizzlies - more certainty, safety and control must be explained in the FEIS. It is not enough to finalize a plan that may take a century to realize, as our current political system too-easily seeks to overturn programs, rulings, and decisions today. How can the managing agencies provide today a guarantee that grizzlies (a historical and needed species in the NCE) will be welcome and protected in the coming years?

Future planning also must include for when this species is removed from the ESA. In other states, including many in the western United States, once a species is delisted, it is "open season" and plans for eradication are quickly back on the table. As the EIS evaluates the interplay between grizzly bears and wolf recovery, it must take for example the plight of wolves in Idaho, Montana, and Wyoming now that they are no longer protected under the ESA. Hunters in these states can indiscriminately kill or trap as many wolves as they like year-round on private land and even on surrounding areas to our National Parks.

<https://www.nytimes.com/2022/01/17/opinion/wolves-endangered-yellowstone.html>)

This focus on other states is also important as the agencies decide how to best protect grizzly populations in the NCE. As listed in scoping, "If the Service (USFWS) finds that grizzly bears in one or more distinct population segments (DPS) in the species' range no longer warrant protection as a listed species, the agency will have to determine whether bears in the remainder of their listed range still qualify for protection under the ESA." It is not acceptable for decisions in other states or areas to overturn or terminate grizzly recovery in the NCE.

Not only is it morally reprehensible to seek to eradicate any species for your own profit and viewpoints, but it is a waste of time, effort, and funding to protect something, reach a threshold, and then start killing that something again. And the killing is not limited to wolves, grizzly bears have also been targeted.

<https://www.seattletimes.com/nation-world/nation/whos-killing-the-grizzly-bears-of-fremont-county-idaho/>

I understand that the NPS and USFWS cannot fully guarantee against future rulings, decisions, or actions by Congress, neighboring states, or private landowners. That will require participation and vigilance by those of us who love bears and want to see them in the NCE. IT IS the purview of the agencies to finalize a decision that incorporates current science, best management practices, public will, and concern for the future fate of this iconic species - to provide a solid roadmap for how to restore, protect, and grow grizzly populations effectively and permanently.

Once again, thank you for restarting the process to return grizzly bears to the North Cascades Ecosystem (NCE). I look forward to additional comments on draft and final decision documents and working and supporting the agencies in this worthwhile effort.

Sincerely,

Northwest Rivers Photography

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.  
Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: The no-action alternative, as written, is not "no action" as it contains the language that is an action "educational programs to provide information about grizzly bears and grizzly bear recovery

to the public". A well crafted no-action would include language that stops the pursuit of any action, including on-going discussions, that seek to reintroduce grizzly bears into the area.

#### Alternative A (No Action)

Under the no action alternative existing management practices would be followed, and no new management actions would be implemented beyond those available at the outset of the grizzly bear restoration planning process. Management actions would be focused on improved sanitation, poaching control, motorized access management, outreach, and educational programs to provide information about grizzly bears and grizzly bear recovery to the public, and research and monitoring to determine grizzly bear presence, distribution, habitat, and home ranges.

Correspondence:	Bad for bears, bad for people.

Unlike almost all pushing this unrealistic plan to airlift grizzlies out of hot water and into the fire, I live next to one of the Pasayten's major wildlife corridors. Think Grizzlies are going to stay inside the Wilderness boundaries?

I frequently encounter black bears on my land. Livestock predation and damage to property happens. Ever increasing numbers of outdoor recreationists push further into backcountry to get away from the crowds. More people, shrinking habitat, and artificial reintroduction of THE apex predator into N Cascades? Recipe for disaster.

Correspondence: Please protect grizzly bears!

As a grandparent of four young children, my main priority is to leave them a living planet. In our family trips to national parks with our children (now grown), we learned much about how different parts of nature fit into the whole ecosystem.

Grizzly bears are a keystone species and are an important part of the larger ecosystem. They lived in the North Cascades for thousands of years, and they belong there.

Please protect them so that in the future our grandchildren will be able to take their own children to national parks full of life.

Correspondence: Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too.

Correspondence: I would like to submit the following comments regarding the National Park Service plans for grizzly bear recovery in the North Cascades. These plans should:

1. Not violate the Wilderness Act - translocate bears in a manner that minimizes stress to the bears either outside of Wilderness Areas or into Wilderness Areas without the use of motorized equipment of any kind, including helicopters.
2. Not designate these bears as an "experimental" population.
3. Not relocate bears from the Northern Continental Divide Ecosystem, where they have not yet developed a sustainable population.
4. Work with Canada to establish wildlife corridors in which the grizzlies are protected on both sides of the US/Canada border.

Thank you for considering my comments.

Correspondence: The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of

Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears. The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

To summarize and emphasize, please note the following:

- I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly

population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

- I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

- The agencies should analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

- The agencies should develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your thoughtful consideration of my views.

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Identify a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I am writing as a biologist (1977 BS Biology, magna cum laude, Phi Beta Kappa), lawyer (1979 JD), a Utah Republican precinct chair, and a member of the Union of Concerned Scientists.

Earth is already in the midst of its sixth mass extinction episode, which is driven by 1) over-population and continued population growth, and 2) over-consumption by the rich.  
<https://pnas.org/cgi/doi/10.1073/pnas.1704949114>

Included within those two drivers are the proximate causes of Earth's sixth mass extinction: Climate disruption, habitat conversion, over-exploitation, toxification, species invasions, disease, and (potentially) large-scale nuclear war.

The National Park Service and the Fish and Wildlife Service must:

1. Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades.

But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington.

Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

2. Oppose an "experimental population" designation.

The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation.

Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

3. Analyze a natural recovery alternative.

This is NOT the same as the No Action alternative.

Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border.

Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

4. Develop an alternative that doesn't violate the Wilderness Act.

The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears.

Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness.

If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Please reconsider your approach to grizzly recovery in the Northern Cascades.

I strongly oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. This plan to kidnap bears from either BC or the NCDE makes no sense, as grizzlies have still not recovered in these regions - there are simply no "extra" bears to move to WA. This will have a detrimental effect on the grizzly population, weakening them even further, and would not allow the needed population linkages between regions.

I strongly oppose an "experimental population" designation. You must create and analyze an alternative, since under that designation bears would no longer be protected once taken from their home range. We must ensure the bears are still protected under ESA.

You must analyze a natural recovery alternative. This means the FWS and NPS need to actively work with agencies in BC to ensure grizzlies are protected across the border. Agencies need to identify and protect corridors and connectivity so bears can move freely across the border without being killed.

You need to develop an alternative that doesn't violate the Wilderness Act. Agencies must not pursue alternatives that would violate this act or involve heavy-handed and stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Please oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and move them to the North Cascades. I believe that grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Please oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. This is unacceptable.

Please analyze, and develop a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without being killed.

Finally, please develop an alternative that does not violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act, and which would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your consideration.

Correspondence: I normally don't comment on proposals that do not affect me directly. But ensuring grizzly bears are part of the future is important. They play a key ecological role as a native keystone species in the North Cascades. Grizzly bears are important to Native American Tribes and First Nations. And the North Cascades is one of the few places where the grizzly bears can exist. Please make sure that these comments are considered. Thank you.

Correspondence: I am a 4th generation resident of WA State and have spent 66 years in our mountains. I am also a part time resident of Stekekin having owned property there since 2017.

My comment on the reintroduction of Grizzlies to the North Cascades ecosystem is simple: FOR WHOSE

BENEFIT? Humans or bears? It is perfectly clear to me that it's the former and that soon after bears have been reintroduced, attacks on humans will begin and the bears will either be shot or relocated. It's abundantly certain.

The NC ecosystem has is no longer what it was when the bears lived here. The penetration of human beings into every corner of the NC wilderness will ensure adverse bear-human encounters and subsequent action demanded of wildlife authorities. Why do we insist on reclaiming something that is no longer natural? Why do we think we are so important? Again, this plan is hardly for the bear's benefit and can only be a marginal benefit for the ecosystem.

Thank you for this opportunity to comment.

Correspondence: Grizzly bears are an essential missing piece to the North Cascades ecosystem. People in the Rocky Mountains are able to live and recreate alongside grizzlies. I want the Cascades to return to an area that supports grizzly bears in the environment. It is important to do that now, as available grizzly bear territory has been severely limited over the past century.

Correspondence: Hello,

I believe that grizzly bear recovery is an important step to take for the betterment of the environment and our culture. I am an employee at Woodland Park Zoo in Seattle and through my job I have extensive interactions with guests from all over the USA and the world. This gives me the opportunity to educate these guests on the ecological benefits from bears, which include the dispersal of seeds and the aeration of the soil. I feel it is important to coexist harmoniously with bears, and something we have done in Washington state with black bears already. Additionally, these magnificent creatures have significant cultural importance to indigenous peoples, so that just reinforces the need to bring them back. And while black bears are currently in good populations in Washington state, they do not fit the same niche that the grizzly bear does, so both are needed for a diverse and healthy ecosystem. Thank you.

Correspondence: I believe grizzly bears should be reinstated to the North Cascades. Every species plays a part in a healthy ecosystem. That has been proven in Yellowstone National Park with their wolf program. It has reduced the number of elk, which has allowed the trees, grass etc to return to it's natural state. Mother Nature created an ecosystem that works. From plant life to prey and predators. Humans have created the imbalance.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I strongly oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone. Not only that - it is cruel to remove bears from their current homes and from their families, There is no existing evidence to indicate that any of these actions would benefit grizzlies in any of the areas mentioned.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA. This plan is so wrong and there is nothing to be gained and much damage could be done.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS

choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. Please do the right thing!  
Thank you!

Correspondence: I am writing because I feel strongly about protecting our wildlife, in particular, the grizzly. The following are some points I would like you to consider:

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your consideration and compassion.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
I also oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.  
Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.  
Thank you!

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: I used to live near North Cascades National Park and visited with regularity. I now live near Grand Teton. I enjoy watching wildlife,

Grizzly bears lived in the North Cascades for thousands of years, and they belong here.

I want to help chart a new future where we coexist with grizzly bears

Grizzly bears play a key ecological role as a native keystone species in the North Cascades

I want to pass down a wild landscape to future generations that includes all native species, including the grizzly.

Grizzly bears are culturally important to many Native American tribes and First Nations

People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades.

There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. Bears need their society intact

I oppose an "experimental population" designation. Do not transport bears. We need a no action recovery system.

Develop an alternative that doesn't violate the Wilderness Act.

If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence Type: Web Form  
Correspondence: I am asking the agencies to reconsider their approach to grizzly recovery in the North Cascades and ask they consider the following points'

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors

and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem (NCDE).

Grizzlies have not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan weakens the NCDE grizzly population and diminishes the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation.

The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation, where grizzlies would lose their protections under the Endangered Species Act (ESA).

I support a natural recovery alternative (not a No Action alternative), especially including wildlife corridors.

The Federal Wildlife Service and National Park Service could actively work with agencies in British Columbia to ensure grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect wildlife corridors and connectivity so that bears can move across the border without getting killed. Wildlife corridors have been proven helpful elsewhere and would be a boon for other wild animals as well.

I support an alternative that doesn't violate the Wilderness Act.

The agencies should not pursue plans that violate the Wilderness Act and entail heavy-handed, stressful management of bears. Should an agency choose to translocate bears, they should only consider translocation to sites outside of designated Wilderness. Anything done within Wilderness must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Thank you for permitting public comment regarding this plan. As you're well aware, our current biodiversity crisis demands that we take action to restore our precious remaining wilds to their natural abundance. I am writing in support of the restoration of indigenous wildlife to their natural ecosystems, but this proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for the natural recovery of grizzlies. Different than the "no action" option, which is to "do nothing," a natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands.

The proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA) is likewise problematic. Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades. This, of course, would be counterintuitive at best.

Please develop an alternative that doesn't violate the Wilderness Act. The key to any truly successful restoration project is to allow nature to do the heavy lifting. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. Any monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. Complying with the Wilderness Act should mean exactly that--respecting wilderness' wildness--to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears would be likewise counterintuitive.

In the long run, these strategies might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own. As I've been taught, 'any job worth doing, is worth doing well.' Thank you for considering my opinions and for doing all you can to give our natural world the chance to heal, thereby enabling all life, including our own, to flourish on this planet.

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies

and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

What is needed:

1) To analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

2) To develop an alternative that doesn't violate the Wilderness Act. Correspondence: I encourage you to reintroduce grizzly bears in the North Cascades. Grizzlies play an important role in the environment as a keystone species. They are also very important for Native American communities.

Grizzlies were hunted to extinction in the area, they did not die out because the conditions weren't right.

Please help restore grizzlies and right this wrong.

Correspondence: I am writing to you because I care a lot about nature, the environment and animals. Grizzly bears lived in the North Cascades for thousands of years, and they belong here. I want to help chart a new future where we coexist with grizzly bears. Grizzly bears play a key ecological role as a native keystone species in the North Cascades. I want to pass down a wild landscape to future generations that includes all native species, including the grizzly. Grizzly bears are culturally important to many Native American tribes and First Nations. People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades. There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.please do what you can to reintroduce them.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: I am writing in support of grizzly bear restoration in the North Cascades, where grizzlies have lived for thousands of year. Not only do they deserve to live there, but they are an endangered species that we must actively recover or risk losing.

Grizzlies are culturally important to many Indigenous people in the region, as well, to non-indigenous people who understand the value and importance of bears in our wildlands.

They also provide ecosystem services, spreading seeds, cleaning up carrion and aerating alpine meadows, like any other native species.

There are few places left in the lower 48 states with habitat as secure, wild and productive as the North Cascades - or where the federal government plans to restore them.

Please support grizzly bear restorations so that we can pass down a wild landscape that includes all native species, including the grizzly. And maybe we will even get see a grizzly bear one day in the North Cascades.

Thank you, [REDACTED]

Correspondence: There exists no merited reason why FWS should not restore grizzly bears to the North Cascades, as a part of its former range that may yet be habitable if humans will henceforth restrain their impulses and learn coexistence. We made a moral commitment in law decades ago to recover endangered species to ecologically meaningful presence, not just token relics and curiosities, and the North Cascades plainly qualifies as part of this presence, even if this requires new habits and new restraint by certain economic interests.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Grizzly bears are native to North America. Their existence means something to me, many communities such native Americans and other citizens, and are extremely important to the eco system. Please make sure grizzlies are afforded all protections needed for the species to survive and propagate.

Correspondence: The initial plan would have decreased protection for Wilderness areas in the states of Washington and Oregon, and reduce support for the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.  
The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten Peak, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the Northern Continental Divide Ecosystem (NCDE). Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.  
The proposed action would designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.  
I strongly oppose all plans to capture and remove grizzly bears from the Northern Continental Divide Ecosystem.

The proposed plan by the US federal agencies is to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. However, it is crucial to remember that grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to the state of Washington. I am alerting you to the fact that use of such a plan would endanger the recovery for the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I strongly oppose all plans to use any of the reintroduced grizzly bears in the NCDE as an "experimental population" designation. Wild grizzly bears should never be considered an experimental population for any population experimentation because they are wild animals. It is crucial that these agencies must create and analyze an alternative that does not rely on the use of any so-called "experimental" population designation. Under such a designation, individual bears from the NCDE, which are currently protected under the Endangered Species Act, would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

However, recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, there are problems with the methods likely to be used. The reintroduction plan is extremely intrusive in designated Wilderness, and relies upon use of activities that are prohibited by the Wilderness Act, and these activities will endanger areas defined as Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would damage the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. It is also important to understand that the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

The success and safety of the translocation plan is in question because there is no documented agreement for Canadian wildlife protection support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

It is documented that the agencies recognize the best place to release bears is in the exceedingly rare wilderness of the North Cascades. The best grizzly habitat is synonymous with Wilderness which documents space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage.

However, the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and actual ground based sightings to document whether the bears are thriving. It is wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

It is also important to understand that the proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing."

I strongly urge the US agencies to please analyze grizzly bears that represent the natural recovery for grizzly bears. The group should be a natural recovery alternative. This plan is definitely not the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat

corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

At this time, I thank you for your consideration of my letter and my recommendations. I strongly urge both the National Park Service and U.S. Fish and Wildlife Service to please reconsider their proposed plans and approach to grizzly bear recovery in the North Cascades areas. As an environmental and wildlife protection advocate, I strongly urge the U.S. agencies to please develop a wildlife observation alternative that does not violate the tenets incorporated in the Wilderness Act.

It is crucial that these agencies must not pursue alternatives that would violate the Wilderness Act and would involve the use of inhumane, or stressful management of any bears. If the NPS continues to choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate bears within Wilderness, these trips must comply with the Wilderness Act which means that that these transfers are done without the use of helicopters or motorized equipment. All experimental observations with the bears should never involve the use of invasive monitoring.

Sincerely,

---

Correspondence: Thank you for wanting to protect and proliferate the Grizzly Bear population. However, please ensure that your efforts do not have negative impacts on their well-being. Capturing and relocating the bears may not be the best practice as their populations haven't yet stabilised in their current habitats. The Grizzlies must remain on the endangered list until their populations are sustainable in their home habitats. Too many humans like to kill them and will look for opportunities if they are not protected. Please research and develop a natural recovery program for the Grizzlies in coordination with US and Canadian wildlife authorities that will allow cross-border movement and protection of these magnificent beings. Please ensure that the new program does not violate the Wilderness act. Thank you, [REDACTED]

Correspondence: I'm writing today to encourage you to reconsider your approach to grizzly bear recovery in the North Cascades. I oppose the idea of relocating bears from British Columbia or the NCDE, as the populations there aren't recovered yet. I also oppose any "experimental population" designations. I would like to see a natural recovery alternative analyzed. This would help ensure that bears are protected on both sides of the border. I would also like to see a alternative that doesn't violate the Wilderness Act. Should the NPS decide to relocate bears, please ensure no helicopters, motorized equipment or invasive monitoring occurs inside the Wilderness.

Thank You.

Correspondence: Please do everything in your power to reinstate grizzly bears into the Northern Cascade Mountains of the state of Washington. I firmly believe that God created this earth and the grizzly bears that once lived there. He made it our responsibility to take of His earth and all that He placed on this earth, including grizzly bears. I understand that they are wild animals but people and grizzly bears have lived and thrived together in the Rocky Mountains therefore they can do the same in the Northern Cascade Mountains of the state of Washington. Grizzly bears are needed in this area to assist in the balance of the wildlife predator-prey relationship in that area of the USA. They should also return to this area for they are an important part of the Native American culture.

Thank you for your service and dedication to our beautiful national parks system.

Correspondence: Please reintroduce Grizzly Bears back into the North Cascades. Grizzlies were once numerous in the North Cascades, but fur traders and settlers killed thousands of them and drove them to the brink of extinction. The last documented grizzly bear in the North Cascades was killed in 1967, and the last confirmed sighting of a grizzly was in 1996. Though a small number of grizzlies live across the border in Canada, they are unlikely to migrate south because of extensive habitat fragmentation such as roads and human development. Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too.

Let's bring them back!

Correspondence: Support for Restoration of Grizzly Bears into North Cascades Ecosystem, Washington

12 December 2022

[REDACTED]  
[REDACTED]  
[REDACTED]

I support the restoration of Grizzly Bears (*Ursula arctos*) to the North Cascade Ecosystem of Washington State.

I have worked and hiked in the North Cascades since 1965. As a Ph.D. Wildlife Ecologist and having spent time conducting carnivore research in wild areas of Africa and central Asia, and the Himalayas of India and Nepal, I have found the North Cascades to be one of a mere handful of intact and unscathed mountain ecosystems on our planet, one of the few relatively undeveloped landscapes where humans do not permanently reside.

I've worked in the North Cascades ecosystem from 1965 to 1969 with the U.S. Forest Service on trail crew and as Wilderness Ranger for U.S. National Park Service. During this time I traveled through much of the what was classified as the North Cascades Primitive Area, Paysdixen Wilderness and North Cascades National Park. From 1994 to 2011 I was Carnivore Research Scientist with Washington Department of Fish and Wildlife conducting research and publishing peer reviewed reports on Black Bears, Canada Lynx and Cougar in the North Cascade ecosystem.

In addition, I've conducted research on wolverine in the Bob Marshall Wilderness of Montana and Pine Marten in the Selway-Bitterroot Wilderness of Idaho. While residing in Kenya I supervised graduate studies of Lions and a variety of species occupying the remnant wild ecosystems in East Africa. I've also conducted research and surveys for tigers in isolated wild reserves of China, and surveys and research on Snow Leopards in the remote wild mountainous ecosystems of Himalaya's of India and Nepal and remote mountains of South Central Mongolia.

While spending the majority of my professional life conducting surveys and research on many of the principle carnivores within some of the wildest ecosystems of the Northern Hemisphere I have only experienced a truly wild mountainous ecosystem within the North Cascades of Washington State. The North Cascades offers our planet one of the few truly wild ecosystems where humans are not resident but only seasonal visitors.

However, the North Cascades is not truly wild without its archetypical carnivore the Grizzly Bear. We owe the earth and our descendants a North Cascades with its true potential representing a fully intact wild ecosystem with a full compliment of large carnivores where Grizzly' roam with wolves, cougars, black bears and variety of meso-carnivores. Reintroducing the iconic Grizzly Bear to its ecological significance can instill the North Cascades ecosystem as a premier place as one of our planets truly wild ecosystems, as it evolved since the beginning of time.

Correspondence: For many reasons I am against introducing grizzlies into our are. As more land devastated with fire it won't take long before they move down to where the food is. We already see it with existing bears. Why introduce a predator into a rapidly growing population, if you want to visit with grizzlies there are plenty of places to do so. Thank you

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.  
Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I am concerned for all wildlife and the state of the environment that they reflect. Helping the grizzly bears to survive somewhere that they have lived for thousands of years should be a no brainer, Coexistence with the grizzly bears is the way to go as they play a key ecological role as a native keystone species in the North Cascades.

Our wild landscape is something to be proud of and to pass on to future generations and that includes all native species, including the grizzly. The Grizzly bears are also culturally important to many Native American tribes and First Nations another part of our heritage.

People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades.

There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

Thank you for doing the right thing.

Correspondence Type: Web Form

Correspondence: This proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the

U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: The restoration of grizzly bear populations in the northern Cascades is an admirable goal, but the present plan to do so is ill-considered and violates the spirit of wilderness preservation. Facilitating a natural repopulation requires patience, but it can be done and would not involve the intrusive presence of helicopters in

ongoing monitoring in what should be kept wilderness. Perhaps most important, it would not involve removing the Endangered Species status of the "experimental" bear population. Successful repopulation must include protection of the bears from hunting. The heavy-handed approach of the present plan is not in keeping with sustainable ecosystem health.

The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. Correspondence: Dear Sir or Ma'am,

I'm writing regarding The National Park Service and the U.S. Fish and Wildlife Service's plan to translocate grizzly bears into the North Cascades Ecosystem in Washington State.

I strongly oppose the capture of grizzlies from the Northern Continental Divide Ecosystem and an "experimental population" designation. I support the analysis of a natural recovery alternative that supports grizzlies on both sides of the US and Canadian borders and a plan that doesn't violate the Wilderness Act.

Sincerely,

Concerned Citizen

Correspondence: Hi,

While i do like a new population of grizzlies in the North Cascades, you must better ensure the wellbeing of the grizzlies and the wilderness.

- the bears (at least any captured in the U.S.) must not lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

- the recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife.

- Will Canada give the grizzlies full protection?

- any monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

- A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands.

Thank you,

██████

Correspondence: Hello - Based on my understanding, I suggest you re-evaluate your plan so it does not entail transporting bears from their current home. I oppose the experimental designation and would like to see another plan that does not violate the Wilderness Act.

We need to quit treating wild animals like our property and respect and nurture them. As parks are essential for that, I appreciate what the National Park Service undertakes.

Thank you.

Correspondence: Recovery in the North Cascades.  
I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population

and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

I don't believe the analyze a natural recovery alternative is the plan to go with. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. All animals should be protected on both sides of the border and at all crossing points. Everywhere in British Columbia and the United States meet even in the wooded area, the grizzlies should be protected and if killed by someone, that person should be punished severely for killing or even harming a grizzly bear.

I believe you should develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Any animal which has been extirpated has left a large void in any healthy ecosystem.

Grizzlies have been extirpated from the entire area which still has the carrying capacity to support a grizzly population

Lessons should be learned from the reintroduction of wolves into Yellowstone National Park.

Within a few years after reintroduction, an entire Trophic Cascade was jumpstarted, resulting in a return of both plant and avian and fish and mammal life that had been missing from the area.

Anytime an Apex animal is reintroduced we have learned that we can expect a concomitant Trophic Cascade

Let's all work to ensure that Grizzlies be given a fair chance to remain on this earth under our human stewardship.

After wiping them all out, it is only morally and ethically right that they be given another chance.

Correspondence: We already have a very low population of animals like deer and elk. If grizzly bears are introduced, they will eat all of these animals, and then eat the native black bears, then eat the salmon in the river, and when they run out of these, they will get desperate and kill livestock, destroy the Buckner orchard, and possibly eat people if they get too hungry. They won't ballance the ecosystem, they will destroy it, then starve and die. This area doesn't have the capacity to contain these huge predators, along with the animals that are already here. A healthy griz can eat up to 30 pounds of meat per day. If a single deer weighs an average of 200 pounds, that means a big bear could eat 50 deer in just one year. This would be devastating to the already meager deer population. Pease rethink your desision. Thanks.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

I'm just hoping there are some competent people behind this who know that saving the bears requires empathy and compassion, as well as Environmental Scientists, Biologists, and PUBLIC OPINION.

Frustrated by stupidity,  
[REDACTED]

Correspondence:	Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Hello,

I am writing to support the "No Action" alternative to the introduction of grizzly bears to North Cascades National Park. The existing plan is in violation of the Wilderness Act and would put undue stress on relocated bears.

The best option is to enable bears to re-introduce themselves, by removing barriers to that. This means establishing corridors for wildlife by removing roads, purchasing private property, etc. Yes, that is practically impossible with how society works now but it is the best means for bears to come back if they choose to do so. Anything else and we're just meddling with nature like we've done for 500K years.

Thank you.

Correspondence: I don't have a lot to add to what you already are aware of, but there are a couple of points that are pretty important that I'd like to add. When the bears catch the salmon from the streams and rivers they drag them into the surrounding forest and leave a large portion of fish to many other animals, but the remains of the fish go into the soil and feed our plants and trees, keeping the habitat for many, creatures, alive and well. Not only do they prepare for their own offspring, they create homes for many others.

Correspondence: Not my own words, however, I agree with them totally:

" Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and

there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!"

Correspondence: The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan. The

proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears. The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades. Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists.

Correspondence: Dear USFWS/NPS:

I applaud this effort to restore Grizzly bears, a public trust resource to the North Cascades (NC) ecosystem. I am supportive of this effort because they are a beautiful top predator species that is struggling across its remaining range; they once roamed freely in the North Cascade ecosystem and the area is one of the few remaining locations in the lower US that is vast enough to support them. In addition to being a keystone species, Grizzly bears are culturally important to many Native American tribes and First Nations, and were wiped out due to our failures to understand their role, importance, and how to co-exist.

I urge the agencies to include as part of any action alternatives an aggressive education/outreach and prevention program (e.g. Bear Smart, BearSAFE) in advance of the actual restoration process. It is vital that people understand how to live in GB country and prevent incidents. This program should include installation of food storage containers in public campgrounds and back country sites; bear resistant trash bins and dumpsters in public areas; working with local communities to encourage the use of bear resistant garbage containers and dumpsters for food wastes (grocery stores, restaurants, outfitters). Additionally, a step up plan should be identified or tiered of that will describe how problem bears (vs accidental encounter in the wild) will be dealt with to avoid injury to persons and to protect wild grizzly that are not habituated or food conditioned.

Thank you,

  
Lake Ann, MI

Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Think about it animals are just like humans they mate some for life. They raise their young just like humans. Unlike humans they kill mainly for food unlike humans who kill just because they want to or for a trophy to show off what mighty hunters they pretend to be. People that kill animals for any reason other than for food for their table should be tried for murder and jailed for life. As for me I probably would shoot those killers.

Correspondence: - I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

- I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

- Please analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

- Please consider developing an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

RE: The PCTA's Response to the 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan Scoping Document

Dear Superintendent,

I am writing on behalf of the 15,400-member Pacific Crest Trail Association (PCTA). The PCTA is the primary private partner, with the federal, state and local land management agencies, in the management and maintenance of the Pacific Crest National Scenic Trail (PCT). The foundation for this private-public partnership in the operation of National Scenic Trails is rooted in the 1968 National Trails System Act. Section 11 of the Act, titled "Volunteer Trails Assistance" states, "... the head of any Federal agency administering Federal lands, are authorized to encourage volunteers and volunteer organizations to plan, develop, maintain, and manage, where appropriate, trails throughout the Nation." Sec. 11(b) continues, "Each Secretary or the head of any Federal land managing agency, may assist volunteers and volunteer organizations in planning, developing, maintaining, and

managing trails."

The involvement of volunteer and private organizations in the operation of National Scenic Trails is re-emphasized in Executive Order 13195, "Trails for America in the 21st Century." The Order states, "Section 1. Federal Agency Duties. Federal agencies will, to the extent permitted by law and where practicable--and in cooperation with Tribes, States, local governments, and interested citizen groups--protect, connect, promote, and assist trails of all types throughout the United States. This will be accomplished by: (g) Fostering volunteer programs and opportunities to engage volunteers in all aspects of trail planning, development, maintenance, management, and education as outlined in 16 U.S.C. 1250." Based on this direction, and captured in our memorandum of understanding, it is the PCTA's role to work with the land management agencies to ensure the best possible management of the PCT and the year-round experiences it affords trail users.

The PCTA supports the purposes and needs presented in the scoping documents and the reintroduction of grizzly bears to the North Cascades Ecosystem (NCE). Grizzly bears are a historically natural part of the NCE, and we support efforts to recover the species and promote an environment that maintains its natural conditions, processes, and species composition. Grizzly reintroduction is consistent with direction in the PCT's designating statute, the 1968 National Trails System Act, to conserve the natural qualities of the areas through which national scenic trails may pass. The Act states:

"National scenic trails... will be extended trails so located as to provide for maximum outdoor recreation potential and for the conservation and enjoyment of the nationally significant scenic, historic, natural, or cultural qualities of the areas through which such trails may pass [emphasis added]."

As planning for grizzly bear reintroduction proceeds, we ask that management of the PCT and requirements from the National Trails System Act are adequately considered and incorporated throughout the planning process. Restoration of a self-sustaining grizzly bear population in the NCE is consistent with the "nature and purposes" for which the PCT was designated as a national scenic trail. The PCT's nature and purposes statement, along with the trail's significance and fundamental resources and values can be found in the PCT Foundation Document.

Throughout the grizzly bear reintroduction planning process, it will be important to recognize that the PCT is a highly valued recreational resource that sees use from thru-hikers (people attempting to hike the entire trail in one season), other backpackers and horseback riders, and day-hikers. Additionally, there are countless other backcountry travelers who use the PCT as part of a broader backcountry or wilderness trip. Altogether, the PCT sees thousands of people per year. This level of recreation use along the PCT corridor should be considered as grizzly reintroduction zones are developed in the environmental impact statement (EIS). The PCTA would like to avoid a situation where access to the PCT is unduly restricted due to concern of bear and human conflicts. With this, we strongly support the language and intent of the following FAQ that was released with the scoping documents:

"Would trails and roads be closed to protect grizzly bears?

There are thousands of miles of trails traveled safely by millions of people in grizzly bear country in the other recovery areas, such as in the Rocky Mountains. Roads on federal lands within the North Cascades Ecosystem have been managed with grizzly bears in mind since the publication of the recovery plan chapter in 1997. Care has been taken to maintain road systems in a way to ensure secure habitat for bears while meeting the needs of people. None of the alternatives require long-term closures."

Further, single-track, non-motorized trails do not necessarily have the same impacts on grizzly bear habitat as do motorized trails and roads; as such, we would like the EIS to analyze potential adverse impacts of each accordingly.

Related to reducing potential conflicts between grizzly bears and outdoor recreationists, we support the intent of the following FAQ:

"Would this recovery effort require visitors to the recovery area to change their behavior?

Black bears already occupy the areas that grizzly bears are expected to be in the future, and much of the human behavior needed to avoid conflict with that species applies to recreation around grizzly bears as well. Learning how to safely recreate in black bear country goes a very long way to learning how to recreate where there are

grizzly bears.

The national park and national forests are already addressing the high-risk elements of human-grizzly bear conflict by increasing awareness of, and/or requiring, proper backcountry food storage and by installing bear resistant garbage disposal systems and food storage lockers in campgrounds in order to reduce human-black bear conflict."

The PCTA is incredibly supportive of additional backcountry bear-resistant food containers (i.e., bear canisters) requirements for overnight users to mitigate against human and bear conflicts. Additionally, we support opportunities to increase public education around how PCT hikers, horseback riders, and other backcountry travelers can recreate more responsibly. We believe that proper food storage requirements and effective public education should negate the need to unduly restrict backcountry and wilderness recreation opportunities.

As the exact effects that reintroduced grizzly bears will have on outdoor recreationists in the NCE is unknown, as well as the impact non-motorized recreationists will have on bear populations, we support the initial reintroduced population being designated as a 10(j) population within the meaning of the Endangered Species Act (ESA). As stated in the scoping document, this will provide managers flexibility to adapt management actions to best accommodate for existing outdoor recreation use as well as ensure impacts to the bear population are mitigated.

We appreciate your time and consideration of the PCTA's comments regarding management of the Pacific Crest National Scenic Trail in relation to the 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan Scoping Document. As the primary private partner in the management and maintenance of the PCT, we are eager to work with the federal agencies to ensure the purpose and need of reintroducing grizzly bears to the NCE is successful, while still providing for the PCT's nature and purposes. Please do not hesitate to contact the PCTA with any questions or to discuss our comments.

In partnership,

Justin Kooyman  
Associate Director of Trail Operations

Correspondence: I encourage the National Park Service to reconsider their approach to grizzly recovery in the North Cascades.

Although a new population of grizzlies in the North Cascades would restore this magnificent species to that

ecosystem, the agencies' initial plan is unfortunately ill-advised in several ways.

1. Please reconsider the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
2. Please reconsider using an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
3. Please analyze a natural recovery alternative. This is NOT the same as the "No Action" alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
4. Please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for the opportunity to comment.

Correspondence: More work is needed before this is implemented.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Isn't the population of bears in the Northern Continental Divide Ecosystem still not recovered? Would this movement weaken this area?

Why not adopt a no action alternative? Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears.

Correspondence: I am writing to demand that the National Parks Service and Fish and Wildlife Service change their approach for grizzly bear recovery in the Northern Cascades range.

The organizations' plans as they stand consist of (1) capturing bears from the northern Continental Divide or British Columbia, (2) designating Northern Cascades grizzlies as an "experimental population," and (3) translocation through methods that violate the Wilderness Act -- i.e., helicopter lifts, invasive monitoring, and use of motorized equipment.

It behooves the agency to take the following courses of action:

1. Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home

range and transported to Washington state, where they would lose their protections under the ESA. Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. Thank you! [REDACTED]

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act

quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: As humans, we rarely use an opportunity to correct our wrongs, to acknowledge our previous ignorance and irresponsibility. Let us use this opportunity to restore grizzlies, a keystone species, to the Northern Cascades and begin to correct a the toll we have taken on that area.. We know now what a keystone species is, that they play an integral part within their ecosystems. We understand that we must restore what we have damaged. What better place to reintroduce a keystone predator than in a National park? We must learn to coexist with apex predators, for the good of those species as well as our own, to preserve what we have left.

Correspondence:	Hello,

This is in addition to a comment I submitted that encouraged appropriate advance education and food storage/garbage management infrastructure to prevent problem people leading to habituated and/or conditioned bears--

1) While these activities/facilities may be present in the park, there needs to be sufficient LE coverage to ensure the education is leading to compliance and if no compliance, enforcement. All the education and infrastructure for food storage/garbage and people management will be for naught if there is not sufficient staffing for proper monitoring and enforcement of laws, policy, and/or guidance.

2) Neighboring communities must be a part of the solution. The NPS and FWS spends a great deal of time/effort working with gateway communities, chamber of commerce/tourism offices to bring visitors to their sites, a similar effort should be made to educate the neighboring communities and visitors about bears, grizzlies, etc.--I'm sure there are lessons learned from Denali, Glacier, and Yellowstone.

Looking forward to a successful restoration of grizzly bears to the North Cascades area!!

Thank you!

Correspondence: Please reintroduce grizzly bears to the North Cascades. You can help save the grizzly bears from extinction, while also improving the North Cascades. Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too.

Correspondence: While the intention of repopulating grizzly bears into the Northern Cascades is a worthwhile endeavor, the proposed methodology violates many current protections for existing bear populations.

Transporting bears to areas where they would no longer be under EPA protection is counterproductive to increasing their numbers. Without adequate protection, bears transported into these areas could effectively be reduced in numbers.

Additionally, the plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement. If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

Alternatively, develop a plan that doesn't violate the Wilderness Act and which would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Please consider a Natural Recovery Alternative, where the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Correspondence:	Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: We strongly believe the following which expresses our views perfectly:

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

his is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Take Action--Help improve grizzly recovery plan for the North Cascades  
Yahoo  
/  
Inbox

The following comments are about the Plan to Recover Grizzlies in North Cascades

The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) have re-started their plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

Wilderness Watch supports the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I also oppose an "experimental population" designation. You must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

I suggest you analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. Please develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring. Thank you!

Correspondence: As a frequent visitor to the Northern Cascades and a lifelong wildlife lover and advocate, I want to implore you all to approve a plan to reintroduce the majestic Grizzly Bear. We all know what a critical role they play in a balanced ecosystem. The grizzly is also an iconic and important animal to Native American tribes and to North American culture. I feel we have an obligation to perfect our wildlife for the future of those species and for humans as well, to never lose touch or forget that all beings have value and deserve to live and thrive. That cannot happen without our direct help and intervention. Our legacy cannot be that so many species were wiped out due to our apathy and greed.

Let's come together and fight for the Grizzly Bear's reintroduction. Let's help them live!

Thank you,

Correspondence: I strongly support the active re-introduction of Grizzly bears into the North Cascades. With decades of previous examination of this topic there should be relatively few new areas of discovery. I hope you do emphasize the extraordinarily low potential for natural repopulation. Due to man's actions we are in the midst of a mass extinction event. It is incumbent upon us to do all we can to rectify this untenable situation. Time is running out for Grizzly bears as well as innumerable other plants and animals. Please act to restore Grizzly bears and protect the habitat that supports them as quickly as possible. While the 10(j) designation may be helpful to expedite a small reintroduction it appears to permit cavalier use of control actions that could jeopardize successful implementation. Tread carefully. Another long evaluation process is tantamount to the no-action alternative. Please expedite the process.

Correspondence: Dear NPS,

I write to you today to offer my comments regarding the capture of grizzlies from the NCDE (or from BC) and their release in the North Cascades.

Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem, please. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery

alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Otherwise, I am only grateful for the wonderful work the NPS does for our nation - keep up the hard work!

Thank you!

Correspondence: Grizzly bears are important to their ecosystems. As apex predators, they help keep the ecosystem in balance. They should be protected from hunting, poisoning, or other means of extermination. If left alone, the ecosystem will balance on its own. Hunting is cruel and testosterone-fueled. We must prevent it unless grizzlies become too familiar with humans and become dangerous. However, rangers or professional animal handlers should be involved, NOT hunters.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Grizzlies belong in the Northern Cascades, but there are issues with your current plan. The population in the Northern Continental Divide Ecosystem is not stable enough to sustain the capture and relocation to the new area. Measures should be put in place to assist bears in naturally resettling the Northern Cascades, much the way the gray wolf is resettling areas. Grizzlies need to be protected on both sides of the border and corridors should be established and protected to make it easier for bears to naturally resettle the areas.

Monitoring should take place in a way that's respectful to Wilderness and bears. It is wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears. Other less invasive monitoring should be conducted, including hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears. The Wilderness Act needs to be considered so that the area is not degraded for other animals already living in the area.

Correspondence: I support this plan to re-introduce grizzly bears to the North Cascades Ecosystem (NCE). Having been born and raised in Omak, and growing up (and still) hunting and hiking in and around the NCE, I love the NCE for wildlife it supports and the vast and wild places. The grizzly bears were a part of the NCE pre euro-american settlement, and I support them being re-introduced.

I would make a few suggestions to enhance rural community support and make this process as smooth as possible:

1) Similar to how Washington and WDFW has gone about wolf re-introduction, provide ranchers with near real-time information on the location and movement of grizzly bears. This will allow ranchers to move their livestock and reduce the amount of cows and sheep killed by grizzly bears. I would even suggest providing a program to compensate ranchers for the loss of their livestock.

2) Create an advisory board that - similar to the Upper Columbia Salmon Recovery Board - has representative board members from local counties and local tribes. This board can help guide the major decisions around specifics of this project. If this board is representative of the local communities, this could greatly increase local support. County commissioners likely will not have time for this board, but have the county commissioners appoint someone from the county to sit on the board. I would not have someone from Olympia or DC choose the representative to sit on the board. Even if the person lives in the county - chances are they will not be representative of the county. And if this happens, public support will likely decrease drastically.

3) As part of the plan, establish a pathway for grizzly bears to be eventually legally hunted. I assume this would be a reasonable population target that, once reached, a small number of special tags would be available to hunt grizzly bears. The idea that Washington state hunters could eventually hunt grizzly bears would go a long way in building the trust of rural communities, since many members would be thrilled at the idea of a grizzly bear hunt. But this plan needs to be clear and agencies need to stick to the plan - otherwise trust will be broken and support will decline.

Thank you for your time and best of luck in this process.

Correspondence: I am writing to ask you to reconsider your grizzly recovery plan. I support of the recovery of grizzly bears and other native species where suitable habitat exists. However, recovery efforts should meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, and without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, the methods likely to be used could be extremely intrusive and detrimental in designated Wilderness.

The plan's proposed helicopter landings would degrade the Wildernesses involved.

Heavy-handed management would not only be harmful to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

Surely agencies recognize that the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Please have the courage, strength, and intelligence to do the right thing and reconsider the current plan.

Thank you sincerely,

---

Correspondence: I support whole-heartedly the re-introduction of grizzly bears into these areas.

The bears were here first.  
Humans need to pull back and give enough space for nature to thrive.

Bears are part of the regular ecosystem, and you can't take animals out and expect an ecosystem to thrive.  
Put the bears back in, and they'll help the ecosystem thrive.

There will be no economic impact. Any livestock can move to private property, and humans can eat more vegetables and less beef.  
We'll be fine and healthier.

Humans need to share, we're greedy and can't kill animals forever.

Correspondence: Hello.

I strongly oppose the capture of grizzlies from the Northern Continental Divide Ecosystem by federal agencies. Kidnapping bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park and move them to the North Cascades is absolutely a ridiculous and cruel plan.

This disturbing management approach will damage the Wilderness and destroy the lives of bears with their initial capture, handling, helicopter flight(s), and attendant stress. As a result of the capture, some bears will be injured and will even die! Bears will be collared, drugged, subject to medical samples taken, and handled for many years. This proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies. In addition, collaring bears sets them up for cruel culling as their population grows, radio-collared bears will be treated the way we have handled rancher and wolf depredation issues, which is described in a sterile term such as "wolf management."

Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. This plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Please develop an alternative plan which won't include using heavy-handed, stressful management of bears, and will not involve more suffering and cruel hunting. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for considering my views.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Thank you for the opportunity to comment on the proposed plan to recover grizzly bears in the North Cascades mountain range. I must express my dissatisfaction with elements of the plan, as outlined below.

1. The The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

2. The NPS and FWS must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to

Washington state, where they would lose their protections under the ESA.

3. The NPS and the FWS must analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

4. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

I appreciate the efforts being made to widen the distribution of grizzly bears. Please consider my criticisms in the development of your final plan.

Correspondence Type: Web Form  
Correspondence: o emphasize (please use your own words if possible):

I STRONGLY Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem to move them to the North Cascades. Grizzlies have not recovered in the NCDE and there are no surplus bears there to move to Washington. The Proposed Action would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. There is no legal justification for removing protected bears from NCDE and translocating them to an area where they are no longer protected under the ESA.

The agency has failed to adequately analyze a natural recovery alternative. This is different from the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed. This would not only protect the bears but would also enhance all biodiversity -- this type of protection is needed immediately as biodiversity continues to be under heavy threat caused by humans.

Any alternatives that violate the Wilderness Act should not be considered. Translocation of protected animals should never be considered outside of designated Wilderness areas. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

I'm sorry to see our government continue to push forward will ill-conceived ideas that humans know better than Mother Nature ... the only thing Humans need to do is to respect and protect Nature. Nature will recover if humans STOP the destruction (destruction includes not providing wildlife corridors, recreational trails, livestock grazing, destruction of native habitat in any form for any reason, etc.)

Correspondence: Dear National Park Service,

I heard about your plan to restore populations of grizzly bears to the North Cascades Ecosystem (NCE) in Washington. While I support reintroducing grizzlies to places they used to call home, including the North Cascades, I noticed there are some details that make this plan misguided. This plan is to capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears. Those bears would be the "experimental population," under section 10(j) of the U.S. Endangered Species Act (ESA). Under that designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades. I ask that you oppose this 'experimental population' designation and instead create and analyze an alternative that does not rely on the so-called "experimental" population designation.

The best way to restore grizzlies to the North Cascades would be to analyze a natural recovery alternative. In other words, it would be best to allow for and boldly promote the natural recovery of grizzlies. That idea is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears, otherwise the bears might risk injury or worse. Using helicopters would also degrade the wilderness involved. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Again, I ask that you oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. There are much better alternatives to bringing the grizzly back to the North Cascades. Thank you.

Sincerely,

---

Correspondence: Hello! I am a resident that live in Seattle, WA. I do not know much about bears, but I know enough to understand that they are important in maintaining a balanced ecosystem. I also know that the population of Grizzly bears has dwindled significantly in the North Cascades region over the past several decades.

I have had friends who are involved in the outdoors and in eco-vonservation who have educated me on bears over the years because of how much they love them as wild animals that they've come across in the area. It has made me grow to love them as well. I now see them with a lense of appreciation and not one of fear.

I do not know if anyone in this review is familiar with the ecologist and conservationist Chris Morgan, but he has devoted his life to understanding and helping bear populations around the world. We are lucky enough to have him reside here in Washington. I know he would be more than ecstatic to have input on this restoration and have a greater understanding of how to do so with the best impact. I would strongly urge facilitating a meeting with him for input.

He runs a nature podcast through KUOW-NPR and can also be contacted here: [info@chrismorganwildlife.org](mailto:info@chrismorganwildlife.org)

Please heavily consider taking action to bring Grizzlies back to the North Cascades. Thank you!

Correspondence: Thank you for taking on the formidable task of reintroducing grizzlies to the Northern Cascades. I applaud the general idea, but have significant concerns about your approach.

1. I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem (NCDE). Grizzly populations in that region have not yet recovered, and are therefore needed in that region in order to stabilize that population, thereby allowing natural population linkages between NCDE and regions such as Yellowstone.

2. Relocated bears should retain their existing protections under the Endangered Species Act, a protection that would be lost if they are designated as an "experimental population" as has been proposed. The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) should analyze a natural recovery alternative and actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

3. NPS and FWS should develop alternative relocation and monitoring plans that don't violate the Wilderness Act. In addition to these violations, current plans would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for your consideration.

Correspondence: I'm urging the park service to move forward in reintroducing the grizzly back into its homeland of the greater north cascade ecosystem.

It is the missing ingredient in the return to a healthy , viable eco system. In an ever more fragmented wild landscape the north cascades will over the grizzly an op to further diversify genetically and offer also the world an opportunity to experience a truly wild and intact national park. I personally have been exploring every backcountry trail in Yellowstone np for over 30 years solely because it is the home to the grizzly. There is no other wild landscape that offers the adivistic experience than that of the grizzly bear outside of Glacier and YNP. The cascades would offer this experience to the world at large.

Correspondence: Don Striker, Superintendent  
North Cascades National Park Service Complex  
810 State Route 20  
Sedro-Woolley, Washington 98284

Dear Don Striker:

The U.S. Environmental Protection Agency has reviewed the National Park Service's November 2022 Notice of Intent to Prepare an Environmental Impact Statement for the North Cascades Ecosystem Grizzly Bear

Restoration Plan (EPA Project Number 22-0058-NPS). EPA has conducted its review pursuant to the National Environmental Policy Act and its authority under Section 309 of the Clean Air Act. The CAA Section 309 role is unique to EPA and requires EPA to review and comment publicly on any proposed federal action subject to NEPA's environmental impact statement requirement.

According to the NOI, the upcoming Draft EIS will assess the environmental impacts associated with actions to restore grizzly bears to the North Cascade Ecosystem. Co-lead agencies, NPS and U.S. Fish and Wildlife Service, along with cooperating agencies U.S. Forest Service and Washington Department of Fish and Wildlife, are proposing to restore the grizzly bear to the North Cascades Ecosystem, a portion of their historic range. Grizzly bears are listed as threatened under the Endangered Species Act in the lower-48 states, and the last confirmed sighting in the project area was in 1996. The restoration plan's purpose is to support grizzly bear recovery, which contributes to broader biodiversity restoration for current and future human benefit and enjoyment.

EPA is supportive of restoring the biodiversity of the North Cascades Ecosystem. We provided recommendations on NPS's 2017 DEIS, and we appreciate that NPS will be considering comments during the previous comment period into their current process. We recommend the following issues for consideration in the DEIS:

- **Environmental impacts.** EPA recommends the DEIS analyze impacts to environmental resources that may result from project activities such as grizzly bear transportation (e.g., helicopter usage), conflict control (e.g., capture activities), or habitat modifications (e.g., road maintenance).
- **Wildlife impacts.** EPA recommends the DEIS describe how the project would maximize welfare and survival of translocated grizzly bears and would minimize impacts to source populations and other wildlife population in the area, particularly those with ongoing recovery efforts. We recommend that the DEIS identify the management differences between ESA-listed non-experimental and 10(j) experimental population designations, as well as the impacts to other ESA-listed species' restoration that may have been experienced due to 10(j) designation. While the proposed re-introduction activities do not directly affect transportation infrastructure, we encourage the DEIS to analyze opportunities to improve ecological connectivity, which would contribute to the safety of human travelers by preventing wildlife-vehicle collisions, to the success of grizzly bear re-introduction, and to the restoration and maintenance of biodiversity in the North Cascades Ecosystem. Additionally, it would be helpful for the DEIS to describe any lessons learned from previous efforts under USFWS's Grizzly Bear Recovery Program.
- **Human activities and public outreach.** EPA recommends the DEIS detail the effects of or overlap with human activities in the area (e.g., legal hunting, recreation, livestock operations). Describe the existing bear-related public outreach and changes to that outreach to minimize negative grizzly-human interactions.
- **Coordination with Tribal Governments.** EPA encourages the lead agencies to consult with the Tribes and incorporate feedback from the Tribes when making decisions regarding the project. EPA recommends the DEIS describe the issues raised during the consultations and how those issues were addressed.
- **Coordination with the Canadian Government.** Given the possibility that the project will capture bears from source populations in Canada, EPA recommends the DEIS describe the issues raised during consultation with Canada and how those issues were addressed.
- **Adaptive management and monitoring.** EPA recommends the DEIS describe a monitoring and adaptive management plan for grizzly bear recovery to evaluate effectiveness. We recommend including an analysis of climate change impacts in the monitoring strategy that discusses how the project will evaluate project success and how it would adapt treatment methods or other management actions to address changes in environmental conditions. It would be helpful to explain in the DEIS the habitat suitability of different areas of the ecosystem and how anticipated change in climate will impact resources for grizzly bears. Additionally, describe the potential effects of future ESA de-listing of grizzly bears.

Thank you for the opportunity to provide scoping comments for this project. If you have questions about this

review, please contact Caitlin Roesler of my staff at (206) 553-6518 and roesler.caitlin@epa.gov, or me, at (206) 553-1774 or at chu.rebecca@epa.gov.

Sincerely,

\*signature in PDF emailed 12/9/2022\*

Correspondence: Grizzly bears play a key ecological role as a native keystone species in the North Cascades. I want to pass down a wild landscape to future generations that includes all native species, including the grizzly. Grizzly bears are culturally important to many Native American tribes and First Nations. People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades.  
There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

Correspondence: I am in favor of reintroducing grizzly bears back into North Cascades Park. The positives far outweigh the negatives. Grizzlies will return the Park to a fully functional ecosystem. The size and remoteness of the park will minimize human interactions. The location to Canadian grizzlies will allow for gene transfer to maintain a viable population. The low density of ungulates in the park will result in a low density of bears, widely spaced throughout the park. Any interaction with livestock outside of the park will be greatly reduced because the surrounding area supports only a few livestock operations on the southeast corner of the park. These and other features of the park make it an ideal location to reestablish a grizzly bear population. Thank you [REDACTED]

Correspondence: Hello,

I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: For me, the ability to see just one grizzly would be a life achievement. That's why I support the reintroduction of grizzled into the north cascades where they had been for years upon years and should be returned. I hope that reintroduction will help ensure that I, and thousands upon thousands more after me, will get that lifetime opportunity to see a grizzly.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: It looks like the NPS is, once again, trying to alter or defy the Wilderness Act to suit its goals of manipulating Nature, There does not exist a "surplus" of grizzly bears in the Northern Rockies--or anywhere in the US, for that matter--to experiment with forcibly relocating them. Motorized vehicles are not allowed in Wilderness Areas. Grizzlies are wild animals, not commercial herds for humans to "maintain" or redistribute for the sake of (some of) us.

Correspondence: I oppose the initial plan of NPS on its Grizzly recovery efforts in the North Cascades since many of the proposed actions will degrade the wilderness area involved, and will likely be detrimental to the long term health of both individual bears, and a lasting healthy population of Grizzlies in the area. There are a number of problematic issues, which I will now detail:

- 1) We should not be capturing grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
- 2) An "experimental population" designation is a bad idea. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
- 3) Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
- 4) Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: To whom it may concern,

Grizzly bears have lived in North Cascades for thousands of years. They play a key part in the growth of the forest. The more we take away the more the world becomes unbalanced. That's their natural habitat. Who are we to say they don't belong there. That's like someone coming to property saying you can't be here. We should be coexisting with nature not take it away. Everyone gets affected when balances in nature are off.

Grizzly Bears have right to live in peace from human persecution. Grizzly Bears should never have been killed off in the North Cascades in the first place. We as humanity need to allow the Grizzly Bears to return to the Northern Cascades but not at the expense of other fragile Grizzly Bear populations. Then humanity needs to get out of their own way and learn to live with Grizzly Bears in a smart way and one way is allowing them the space to roam freely.

Correspondence: Please do not move grizzlies from the still-struggling population in Canada and the NCDE to Washington. The grizzlies in the NCDE have not recovered and moving them would reduce the chances of developing linkage populations with places such as Yellowstone. Instead, analyze alternative natural recovery actions that are not in violation of the Wilderness Act and would cause stress to the bears. I am also opposed to designating a new population in Washington as an "experimental population" because the bears would then lose their endangered species designation which they currently have within the NCDE.

Correspondence: I favor the active reintroduction of grizzly bears to the North Cascades Ecosystem in Washington State.

While I live in Oregon, I work and spend lots of time across the river in Washington.

I have hiked and backpacked in grizzly bear country in Montana and Alberta, Canada, and am familiar with the occasional conflicts between humans and grizzlies. I am also confident that with adequate measures those

conflicts can be significantly reduced, and that the costs of having grizzlies back on the landscape are outweighed by the benefits of having them back.

Our ecosystems are degraded, and one form of degradation is the loss of top predators and other keystone species. In the North Cascades the grizzly is such a keystone species. Bringing back the grizzlies will benefit the ecosystem. They will also benefit we humans, by providing us with both the experience of viewing the bears, and the knowledge that they are there. And the bears have a right to exist.

I understand that actively restoring grizzlies is known as "Alternative B"; If so, then I support Alternative B, and urge us to start bringing grizzlies back to Washington.

Correspondence: Thank you for the opportunity to comment. As we watch endless species, large and small, approach extinction, this opportunity to provide a path for improving grizzly existence is very welcome. Public fear of this iconic animal is understandable in many places, yet those fears must not result in its extinction. The North Cascades region, shared with the wilds of Canada, offers the best habitat, the safest public experience, and the least impact on livestock operations. Please continue this important work and carefully weigh a science-based future for the grizzly against the alternative.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Being a lifelong resident of Texas I am a long way from any grizzly habitat but am in favor of grizzly reintroduction. Wildlife (especially native American large predators like the grizzly, wolf, mountain lion) preservation and their habitat is important to the overall health of the environment. In this day when so many outdoor recreation areas are too often molded for the use of day users and paved trail hikers there needs to be truly wild and remote places where nature can exist as it once did.

Thank you for your hard work and effort in this endeavor.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I support the option of no action.

This proposal is being put forward by the Department of the Interior, National Park Service but is mandating an action for a land area which is mostly not in its jurisdiction. This is proposing an unfunded mandate for other departments and agencies that are already stressed to manage fire, invasive species, climate change, natural resources, and dramatic increases in recreation and home building. Therefore the funding and sustainability of the proposal is completely unrealistic.

There is no analysis of how many bears whose lives are tampered with will die.

All indications are that the relatively small number of bears that will survive long term will become a genetically isolated stressed anomaly.

I would conclude that the money could be better spent to help the bears, except for the problem that there is no realistic effort in this proposal to address sustainable management anyway.

Correspondence Type: Web Form  
Correspondence: I am writing to oppose your approaches to grizzly bear recovery in the North Cascade Mountains. Having a new population of grizzlies in the NCDE is desirable, but consideration must be given to unintended consequences. Wilderness should be preserved, not degraded.

Removing bears from their current habitat in British Columbia or the NCDE will not benefit the bear population. There are no "extra" bears in that range. Creating connections and protected wilderness corridors so that bears can naturally increase their own populations is a better alternative.

Creating an "experimental population" will result in bears losing their ESA protection, resulting in bears being shot and killed. It is counterproductive to rebuilding a bear population in the North Cascades.

NPS and FWS must implement an alternative that does NOT include the use of helicopters, motorized vehicles and equipment, invasive monitoring, drugging bears, capture, and excessive handling.

Bears need space to roam, isolation, denning sites, distance and protection from human conflicts and the temptation of human garbage. The agencies should analyze a natural recovery alternative. It would allow for, and vigorously promote, sharing wild spaces between humans and bears. This would require U.S. agencies to partner with B.C. agencies to protect bears on both sides of the border.

Thank you for considering my views.

Correspondence: I write in support of grizzly bear restoration in the North Cascades Ecosystem (NCE). The NCE is the ancestral home of the grizzly. We humans have negatively altered too many parts of our environment. Grizzly reintroduction will restore a portion of the natural order.

The North Cascades National Park is both one of the most beautiful and most underutilized preserved environments in our part of the world. As such, this park provides a tailor made wilderness for this species reintroduction.

The beauty and majesty of these animals should be enjoyed by future generations in our local mountains. As a father and grandfather I urge restoration in part so that these bears can be a part of the wilderness experience for those who, like me, are fortunate enough to grow up here in Washington.

I have lived in western WA but I grew up in eastern WA. I am mindful of the friction that will likely arise between bears and ranchers and farmers. Part of restoration should include education and reimbursement for damage done by grizzlies.

Thank you for your consideration. [REDACTED]

Correspondence: Our family is excited to learn that the "National Park Service" and the "U. S. Fish and Wildlife Service" have restarted the process of returning grizzly bears to the North Cascades!

The grizzly bear is a, critical, part of the ecological, and, cultural, fabric of the North Cascades! They belong here. Without them, our, wild, areas are diminished, less diverse, and, sanitized. The narrative about "Cascades" grizzly bear recovery will take decades to unfold. But, with science, education, and a, little, human tolerance, it can be one of our, and, future generations, 'greatest, conservation, success stories!

Federal and state agencies have worked, for decades, to lay a, sound, scientific, and, social, foundation for reestablishing grizzly bears in the "North Cascades Ecosystem", which has some of the, most, productive grizzly (brown) bear habitat in the world!

Our family members care about restoring grizzlies to this landscape! We support grizzly restoration in the North Cascades because:

Grizzly bears have lived on this landscape for thousands of years and deserve to be here!

Grizzly bears are, culturally, important to, tribal, people, and. Washingtonians who have lived here for generations.

Grizzly bears are an, endangered, species that we MUST, actively, recover or risk losing.

We want to pass down a, wild, landscape that includes, all, native species, including the grizzly.

Grizzly bears provide an, ecosystem, service, spreading seeds and aerating, alpine, meadows.

There are few places left in the U.S. where grizzly bears can exist! The North Cascades ecosystem is one of those, few, protected places!

We hope to see a grizzly bear in the North Cascades!

Correspondence: Please consider reintroducing Grizzlies to the Northern Cascades. Grizzlies are a keystone species. They were a critical part of the ecosystem before human activity decimated their numbers. Reintroduction would help to balance predator/prey relationships that have been out of whack since the grizzlies were lost in this region. For proof of the benefits of reintroducing keystone species look at what wolves have done in Yellowstone. Please bring back the bears!

Correspondence: Hello! I am writing this comment in favor of the re-introduction of grizzly bears to the north cascades national park. The native fauna and flora of our landscapes have been, to put it mildly, decimated by human activity. From the mountains to the prairies we have over and over again removed keystone species out of an ignorant or erroneous mindset. That is why I am writing this comment today. We do know better than we did ten years ago, fifty years ago, and one hundred years ago. We know that bears are a keystone species, whose impacts on the landscape are irreplaceable as they spread seeds, create disturbances, and feed on other wildlife. Their actions impact the balance of flora and fauna alike. They have evolved with the landscape to produce a net benefit and re-introduction will help them to assume that keystone role once more. Introduction would be an act of restoration for the good of the whole ecosystem. Thank you.

Correspondence: Grizzly bears are a critical part of the ecosystem.  
We must stop looking at the world through the Cartesian framework and understand, once and for all, that all life forms are interconnected and, as such, each depends on and cannot thrive without the other.  
Grizzly bears have lived in the North Cascades for thousands of years, where they still belong.  
There is no reason we cannot coexist with grizzly bears.

Correspondence: I love wildlife so much. Knowing that we are protecting what remains of our natural landscape brings me some peace as I took in the city during the school year and spend as much time as I can in our national parks and forests during breaks.

Grizzly bears have lived in the North Cascades for thousands of years, and they belong here. I want to help chart a new future where we coexist with grizzly bears. They play a key ecological role as a native keystone species in the North Cascades and I want to pass down a wild landscape to future generations that includes all native species, including the grizzly.

Grizzly bears are culturally important to many Native American tribes and First Nations.

People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades. There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

Protect grizzly bears in the North Cascades, please.

Correspondence: Grizzly Bears are some of the most fantastic and beautiful wildlife to view and wildlife viewing is one of my favorite reasons to visit National Parks. I would argue that Grizzly Bears are not only a keystone species that will help thrive in the North Cascades but will help return the ecosystem to what it was before human interaction and degradation. Grizzly Bears are a symbol of both the National Parks and the West. Grizzly bears lived in the North Cascades for thousands of years, and they belong here. I want to help chart a new future where we coexist with grizzly bears. Grizzly bears play a key ecological role as a native keystone species in the North Cascades. Correspondence: Living with Grizzly bears as a part of life here in NW Montana, they have and are a part of every forest system, every park, and are good at cleaning up the forest, attacks are rare and can coexist with folk if people are responsible. Im for reintegration of Grizzly Bears more often than any other creature, they manage game numbers fairly, and dont chase off elk and deer which is common with wolves. Grizzlies prefer the high peaks, which are devoid of constant human contact, run-ins are and will be rare. Grizzly bears are important to the environment, and a majority of hunters will gladly pick the bear over the wolf, as Bears can manage the weak and sick game, preventing overpopulation. Its worked in Yellowstone, and Grizzlies are the Icon of Glacier. If we wish to keep the cascades wild, lush, and healthy; Bring the Bear back. Thanks for listening to my comment, Love -

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that

would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you,

Correspondence: I definitely approve of and would love to see the introduction of Grizzly Bears to the North Cascades National Park and North Cascades area in general. They once roamed this land freely and we have hunted them, with so many other of our predators, almost to extinction. The ecosystems of the North Cascades cannot survive without All of the predators and prey that historically have called this area home, and that includes the Grizzly Bear.

People must learn to live with this majestic creature, and I also strongly suggest that there be training meetings for the public in all areas within 100 miles of the North Cascades National Park. People have learned to fear our natural predators, instead of learning to respect them and make sure that people aren't tempting bears to drift down into the surrounding towns.

I also would like to see bear hunting made illegal, at least in the Spring when they are at their most vulnerable state and have cubs in tow.

Thank you,

Correspondence: Hello,

I ask the you please consider the following actions and plans.

1. Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

2. Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

3. Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

4. Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Grizzlies, like all wild animals have been pursued by human greed to a point of destruction. I want more Grizzlies in the North Cascades, but I have many issues of disagreement with many items in your proposal.

I OPPOSE the CAPTURE of grizzlies from the Northern Continental Divide Ecosystem. Federal agencies should NOT be allowed to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) and moved to the North Cascades. There are no extra bears to move around. This plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between NCDE grizzlies and those elsewhere, i.e. Yellowstone.

I OPPOSE the "Experimental Population Designation". The agencies must use ecological science to create and analyze an alternative. Individual bears from NCDW are currently protected under the Endangered Species Act. (ESA) Kidnaping them from their safe have and then transporting them to Washington State would be a travesty against the ESA. The ESA must be enforced. I believe STRONGLY in natural recovery and feel that this alternative must be considered. Under this system the NPS and FWS must actively work with British Columbia to ensure grizzlies are PROTECTED on both sides of the border. With this the agencies should identify and protect the corridors of travel so that bears could move across the border without being culled.

Some of these proposed alternatives from the agency would violate the Wilderness Act (W.A.) We cannot tolerate any alternatives that would entail heavy handed, stressful management of bears. The law Must be followed.

Please HELP the bears, do not endanger them in any way.

Correspondence Type: Web Form  
Correspondence: I am opposed to the initial plan to translocate grizzly bears into the North Cascades Ecosystem in Washington. The agencies' initial plan is far from ideal and would likely degrade wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

Designating the reintroduced grizzly bears as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA) would result in this population losing their current protections under the Endangered Species Act (ESA) and they could be shot, re-captured, or killed in the North Cascades.

If the Park Service adopts a translocation plan, it must be in line with the protections of the Wilderness Act. Monitoring should take place in a way that's respectful to wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

It is essential that you analyze a natural recovery alternative! The FWS and NPS needs to work directly with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border, so that they identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Thank you in advance for developing an improved alternative plan that will ensure these bears success.

Correspondence: I prefer the No Action alternative. Based on a 2018 NPS report titled A Synthesis of Historical and Recent Report of Grizzly Bears (*ursus arctos*) in the North Cascades Region states the following:

"Predictive spatial models that can accurately determine grizzly bear occurrence and persistence across landscapes show that human settlement and associated negative interactions can be more important in determining grizzly bear presence than habitat and food quality (Mattson and Merrill 2002, Apps et al. 2004, Mowat et al. 2013). ... Rode (2005) found that even a single human can displace grizzly bears from high-value feeding sites at relatively remote spawning streams in Alaska, and that this sensitivity is profound even at a landscape level."

Considering the human population on the west side of the NCE and the amount of recreation within this area, it seems a longshot the bears would thrive here. Your own literature makes mention of that above.

Please include in the EIS analysis the following:

1. Total duration cost to implement/mitigate the recovery program within the greater NCE. Include cost to Forest Service, state and private stakeholders.
  - a. relocation of bears
  - b. Recreation requirements for mitigation
  - c. Private and state costs
  - d. Enforcement
  - e. Outreach
  - f. Management
2. Who will pay for the needed personnel to implement the program? If the long-term implementation and management funding for all agencies is not available, relocating bears will not end with a successful viable population.
3. Use predictive spatial models and show the results that reintroducing grizzly bears will have any real success of becoming persistent in the NCE. Washington has between 4-19 times the human population density compared to areas where grizzly bears are thriving.

Washington 116 people/mile<sup>2</sup>

Montana 7 people/mile<sup>2</sup>

Wyoming 6 people/mile<sup>2</sup>

Idaho 23 people/mile<sup>2</sup>

4. In order for the grizzly bear to flourish, will it require killing other species such as black bear? If so how many, how long, who does the killing?
5. Why is the USFS, with 75% of the NCE, not a major part of this EIS? Recreation is significant within NCE, many people accessing the core area where the NPS complex is located travel through USFS lands.
6. Will trends of increasing human population in and around the NCE actually be included in the analysis, or brushed aside given "Grizzly bear density is roughly inverse to that of human population density" (Mattson and Merill, 2002; Mowat et al.,2013)?

Thank you, [REDACTED]

Correspondence: I am writing in support of the plan to reintroduce grizzly bears to the North Cascades. The health of the environment matters a lot to me, as a young person. Since we are in the sixth mass extinction, there are many species that will be gone by the time my generation reaches adulthood and countless more that our children will never get to see. Although every species plays an important role in the ecosystem, grizzly bears are especially crucial as they are a native keystone species in the North Cascades.  
I believe we have a responsibility to not disrupt ecosystems any further and to try our best to restore them to their natural and healthy state. This way, someday when I am older I can pass down a wild landscape to future generations that includes all native species: both the grizzlies and the many plants and animals that they support.  
Thank you for your consideration.

Correspondence: I write to convey my full support of the prospect of Grizzly reintroduction in the North Cascades. This vital and endangered species needs our help in the interests of genetic diversity to connect isolated populations across their historic range throughout the mountain west extending to the Pacific and ultimately south into their CA North Coast and Sierra Nevada ranges. As a resident of Northern CA and frequent visitor to our nation's National Parks, I hope to have additional opportunities to observe these magnificent creatures in more areas of their historic range in the coming decades.

Sincerely,

[REDACTED]

Correspondence: Given the disastrous climatic changes on our beautiful planet, I strongly advocate for increasing our biodiversity in every possible way while we still have a chance to survive.

Grizzlies have lived here for thousands of years and deserve a chance to live too. People have not done a very good job of stewarding our earth. Animals contribute so much.

I am a passionate advocate for all wild animals and an activist for preserving as many beneficial species as humanly possible.

Please reintroduce them and let them thrive.

Thank you.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that

would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you!

Correspondence: Hello, I'm writing to share my support in reintroducing Grizzly Bears to the North Cascades. I am an avid nature lover, and I believe we have a responsibility to both preserve and restore the ecosystems that have been damaged and destroyed by human exploitation. There are only a few places left where grizzly bears can exist, and the North Cascades is one of them. Grizzly bears lived in the North Cascades for thousands of years, and they belong here. played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too. I hope that the National Park Service will take this important action to help a keystone species return and thrive, and to be an example of how humankind can coexist with and support the natural world.

Correspondence: We have an obligation to protect this land we reside on. That includes protecting native wildlife and fixing our mistakes. We must reintroduce animals to their homes. As someone living in Alaska, where moose and bears roam, I can promise you that people and wild animals can co-exist. We need to share this land we are blessed to live on. Or we will have nothing. These animals are key for environmental balance. For our own welfare and for that of our children, for the planet we live on, please reintroduce these grizzly bears where they belong.

Correspondence: I support grizzly restoration in the North Cascades because...

Grizzly bears have lived on this landscape for thousands of years and deserve to be here.

Grizzly bears are culturally important to tribal people and Washingtonians who have lived here for generations.

Grizzly bears are an endangered species that we must actively recover or risk losing.

I want to pass down a wild landscape that includes all native species, including the grizzly.

Grizzly bears provide an ecosystem service, spreading seeds and aerating alpine meadows.

There are few places left in the U.S. where grizzly bears can exist. The North Cascades ecosystem is one of those few protected places.

I hope to see a grizzly bear in the North Cascades one day.

Sincerely, [REDACTED]

Correspondence: I can't believe we have to comment again on Grizzlies in the Cascades. I attended Newhouse's meeting in Okanogan consisting of ranchers, farmers, hikers, etc., and it was obvious to me that the majority do not want grizzlies in our backyard. Haven't we all had enough with the wolves? Times have changed and we have many more people going into the wildernesses which would probably increase encounters

with bears. Grizzlies are unpredictable and it would only take one death to prove my point that we don't need them in this highly recreationalized area. I have always enjoyed going up into the Pasayten Wilderness and not having to worry about large predators. There are just too many people up in the woods these days and even more South of us. Why do the environmentalists keep pushing for these creatures? They are not extinct and doing well North of us and in the Rockies. Besides, with all the people in the woods these days I would suspect the bears would not find the North Cascades as good habitat.

In addition, I'm afraid bears are not going to stay just in the wildernesses, parks, or forests. Like at Yellowstone, they migrate into popularized areas and kill livestock. I can't imagine us wanting to have Grizzlies around our cattle and sheep, dogs and kids, or that you might have to fear coming out of your house at night.

AGAIN, I say a big "NO" to Grizzlies in the Cascades as well as wolves. We have too many people around now to have these large predators in our ever shrinking wilderness. Why aren't people listening to Dan Newhouse? How many times do we have to say no?

Correspondence:	Hello:

I have always enjoyed national parks and watching wildlife. I have visited several national parks including Yellowstone, Glacier and the North Cascades. In Montana I hiked in grizzly country without any incidents.

Grizzly bears lived in the North Cascades for thousands of years before the white man, and they belong there now. I believe people and grizzly bears can coexist.

Grizzly bears can play a key ecological role as a native keystone species in the North Cascades, like they do in the Northern Rockies. Grizzly bears are culturally important to many Native American tribes and First Nations and this should be respected.

People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can also in the North Cascades. Now there are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

So I am asking that grizzlies be restored to the North Cascades.

Correspondence: Grizzlies should absolutely, positively be reintroduced in North Cascades NP and adjacent wildlands. I have lived in Montana and Alaska and have personal experience co-existing with Grizzlies and there are proven successful strategies for so doing so safely for both bears and humans and in ways that support and foster thriving economic conditions in adjacent communities. Utilizing all remaining habitat suitable for grizzlies should occur and that includes the North Cascades. Implementation should occur utilizing methods that are consistent with the Wilderness Act in Wilderness areas, including in North Cascades NP and on adjacent National Forests. Use of motorized equipment and mechanical transport should not occur in designated wilderness to accomplish re-introduction. Monitoring of reintroduced animals should be accomplished without the use of moto/mech in order to preserve wilderness character. Reintroducing grizzlies is long overdue and will improve the preservation of wilderness character. Please do so in a way that is consistent with the intent and letter of the law. Thank you for the opportunity to comment.

Correspondence: As someone who enjoys hiking, camping, and cycling in the Cascades, I am NOT excited about the idea of re-introducing grizzly bears. Black and brown bears are enough. Having seen grizzlies in the wild on several occasions, it is very hard to relax recreating in grizzly country. A park ranger was killed by a grizzly mountain biking near Whitefish, Montana just weeks after my daughter and I were biking in the same area. My brother's tent was trampled by a bear. For those excited to see and interact with grizzlies, I would recommend driving a few hours to Montana or British Columbia.

Please don't share my personal information.  
Thanks.

Correspondence: As an apex predator, the grizzly bear is essential in achieving a balance of nature. Aped predators reduce the number of lesser predators such as coyotes, foxes, skunks, etc. that prey on ground nesting birds such as the ruffed grouse. By removing the sick and lame from elk and deer herds, they also help eliminate diseases such as hoof-rot and achieve healthier, more robust herds. There is no reason the grizzly bear should not find a home in the North Cascades National Park as well as the Glacier Peak Wilderness Area adjacent to it where few people exist. About 20 years ago I was very privileged to see, while backpacking, a grizzly mom and cub on the South side of Glacier Peak. Their present likely absence makes the area poorer and less vibrant. Please return this magnificent species to the North Cascades where it once lived!

Correspondence: I think this plan has good intentions, but is misguided. We who volunteer or work in the conservation and restoration area have learned so much about preserving large areas and creating connections between well-managed and legally protected area that are managed by public and private entities. It would be better to encourage the growth of the grizzly population where they are and let the population naturally disperse to other protected areas.

It seems ludicrous, complicated and very expensive to trap and relocate bears by helicopter.

Correspondence: I favor the re-introduction of Grizzly Bears into the North Cascades. I feel there are a number of locations in the North Cascades that are large enough and sufficiently remote to support a Grizzly population of a size of up to perhaps 50 bears. Those include regions east and SE of Glacier Peak, in the Western portion of Twisp River, North of Rainy Pass, and along the shores and adjacent mountainous areas of the north and part of Ross lake and the Chilliwack and Baker River areas. There is ample food in those areas, and those foods include an abundance of Huckleberries.

I have hiked extensively in the North Cascades and in significant parts of British Columbia as well. While some may fear Grizzly Bears, my experience and the studies of Steven Herrero prove that the threat to humans is relatively small; and but a minor risk compared to wilderness travel risks that many assume voluntarily.

One of my friends is Sepp Renner, who managed Assiniboine Lodge in the Canadian Rockies for 35 years. In a 2015 visit I asked Sepp if he knew of any negative encounters in that heavily used area over that long period. His comment was that he did not. I had occasion to also ask Andy MacKinnon of the Pojar and MacKinnon series of BC and Yukon native plant series of books if he had had any negative experiences with Grizzlies. For thirty years, MacKinnon told me, he and Jim Pojar had surveyed the native plants throughout BC for the Canadian

Government. When asked if he had had any negative experiences with Grizzlies; his reply was &quot;Only positive ones.&quot;

I think it is important to distinguish as to risk, Grizzly behavior in BC versus Alaska Brown Bear behavior in Northern BC, Aleutians, etc. In conclusion the human risk of re-introduction of Grizzlies is low, very low.

I believe we as citizens have the mandate to preserve our environment as best we can so that we can pass on to future generations ecosystems that are as complete and intact as we possibly can.

Lifelong Washington, Western US, and Western Canada hiker, skier and educator.

Correspondence: I support grizzly restoration in the North Cascades because...

Grizzly bears have lived on this landscape for thousands of years and deserve to be here.

Grizzly bears are culturally important to tribal people and Washingtonians who have lived here for generations.

Grizzly bears are an endangered species that we must actively recover or risk losing.

I want to pass down a wild landscape that includes all native species, including the grizzly.

Grizzly bears provide an ecosystem service, spreading seeds and aerating alpine meadows.

There are few places left in the U.S. where grizzly bears can exist. The North Cascades ecosystem is one of those few protected places.

I hope to see a grizzly bear in the North Cascades one day.

Correspondence: Hello,  
Since childhood, I have had an interest in national parks and in restoring wildlife to our natural areas. I remember when wolves were reintroduced to Yellowstone, and now I am writing to you about reintroducing grizzly bears to the North Cascades.

In the west, where I grew up, we have coexisted with grizzly bears for many years. I remember hearing stories about terrifying encounters with them, and they were known to rip car doors off. By now we have learned to get along with them, and I know that humans in the North Cascades will do the same. I also remember a time my sister encountered a bear in Pennsylvania, and by then it knew to avoid humans. It left without incident.

Our car designs and trash cans have improved, and with education and wildlife awareness humans will learn to coexist with bears. They have done so in the Northern Rockies, Yellowstone, and Pennsylvania, and the can do so in the North Cascades.

The grizzly has lived in the North Cascades for thousands of years, but like the grey wolf has been removed from the area due to hunting and other human activity. However, it remains a keystone species, and the natural environment cannot function properly without it. It should be reintroduced to support the environment where it belongs so that future generations can have a natural world with all of the native species that it should.

The grizzly bear is also culturally significant to many Native American tribes, and they, too, have coexisted with it for generations.

Thank you in advance for considering my comments. I hope that you are successful in reintroducing the grizzly bear to the North Cascades.

Best Regards,

[REDACTED]

Correspondence: I oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

I oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wilderness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: Please accept my comments to the reintroduction of grizzly bears in the north cascades of Washington State.  
Grizzlies were once numerous in the North Cascades, but fur traders and settlers killed thousands of them and drove them to the brink of extinction. The last documented grizzly bear in the North Cascades was killed in 1967, and the last confirmed sighting of a grizzly was in 1996. Though a small number of grizzlies live across the border in Canada, they are unlikely to migrate south because of extensive habitat fragmentation such as roads and human development. It's time we add a top predator mammal to the habitat of the north cascades!

Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too.

Sincerely,

---

Correspondence: I am always saddened to learn when wildlife has been eradicated from what was their home turf for centuries. This notion that some humans have come to adopt that they have eminent domain over all flora, fauna, and fungi is sad, disgusting, unsustainable, and just plain wrong.

In the grander scheme of things (look up on a clear night), we are as a dust mote in the vastness of space. How dare we declare ourselves preeminently entitled to lay waste to our minute island! We humans know how to share

and live in cooperative peace with all on Earth; we've done it before.

Grizzly bears are part of the ecosystem that were (and in places, still are) hunted to extinction, either for furs/greed or as perceived preemptive protection before any actual threats materialized. Please reintroduce these beautiful creatures to the northern forest regions in the Cascade Mountains. They are one among many species that deserve repatriation to their native territories - and yes, I'm referring to human as well as wildlife.

Correspondence: I feel that it is critical that immediate action be taken to bring grizzly bears back to their historic range. They are an important part of the ecosystem and can help restore biodiversity to the region. Anything that can be done to prevent poaching and protect habitat would be great as well as any initiatives to help bears breed and produce cubs, expand native food sources for bears (native trees and shrubs to provide berries and seeds, clean rivers to provide fish for bears etc.). A healthy well-managed forest should provide everything needed for bears to return and make a home there.

Correspondence: Hello there,

I buy an annual NPS pass just about every year. I plan on taking my children to our beloved National Parks and National Forests someday, where I intend to teach them as much as I can about nature, wildlife, and our species' relationship with these ecosystems. I understand there is resistance to reintroducing grizzlies to some local residents' "backyards" in and around NCNP. However, while these bears may represent a short-term threat or cause fear, the long-term reality we face is existential. Simply put, if we as a society don't start rewilding and ensuring the survival of other species and ecosystems as the apex predators and de facto stewards of this planet, then we very literally are digging our species' own grave. Human caused climate change is occurring. It has been scientifically proven. So, there's no excuse - we know there is a problem, and we know there are some actions that we can take in order to soften the blow, delay it, or potentially reverse it. Restoring an ecologically influential species to its native habitat can have incredibly positive consequences. Just look at the wolves and beavers of Yellowstone.

We can continue to consume, kill, dominate, and destroy these species and their ecosystems. But we will ultimately suffer the same fate because like it or not, we are a part of Earth's macro-ecosystem, and the more we slaughter, the less likely we'll survive. It's a collective choice we have before us. This reintroduction is one small step that can be taken (or not) to move us if only slightly in the right direction.

Below are some additional, great points shared with me by Sierra Club:

Grizzly bears lived in the North Cascades for thousands of years, and they belong here.  
I want to help chart a new future where we coexist with grizzly bears  
Grizzly bears play a key ecological role as a native keystone species in the North Cascades  
I want to pass down a wild landscape to future generations that includes all native species, including the grizzly.  
Grizzly bears are culturally important to many Native American tribes and First Nations  
People in Yellowstone and the northern Rocky Mountains live, work and recreate alongside grizzly bears, and we can too in the North Cascades.  
There are only a few places left where grizzly bears can exist, and the North Cascades is one of them.

Thank you,

Correspondence: I'm extremely excited to see the reintroduction of grizzly bears back on the table after a handful of years. I highly support the reintroduction of grizzly bears into North Cascade National Park. We can't rely on Canadian laws to protect populations that may eventually, at whatever point, safely migrate into Washington. The potential concerns surrounding their reintroduction, mostly related to few property owners, are far outweighed by the benefits. I support the initiation of another EIS and hope political pressures don't once again derail a great restoration and conservation project.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem.

The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation.

The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative.

This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act.

The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you.

Correspondence: I support bringing back the grizzlies, but feel there are too many problems in your current proposal. One of which is that it ignores the spirit of the Wilderness Act as it relies on very intrusive radio-collaring, helicopter landings and constant disruption of the bears' lives with sedating, capturing and ongoing handling. They end up being treated like captive zoo animals. This plan is extremely heavy handed which probably satisfies the humans in charge, but I feel the over handling could be very counter-productive for the bears. They are wild animals so the less handling of them, the better. (If you proceed with this plan, I would ask that monitoring take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving.)

I also don't agree with snatching bears from their homes in Canada and/or the Northern Continental Divide Ecosystem (NCDE) around Glacier NP to relocate them to the North Cascades. This is not a good idea since grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. This kind of plan would weaken the NCDE grizzly population and reduce the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Therefore, I support bringing back the grizzlies naturally, since your plan is way too invasive. I believe a Natural

Recovery Option should be discussed. It would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification that you are seeking of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Correspondence: Hello.

I am a lifetime resident of Washington State and a lover of animals and nature. I hike regularly and began backpacking this year. This has allowed me to become more aware of wildlife in and around Washington State, but there is one creature missing! Please consider reintroducing grizzly bears to the North Cascades. They were once an important piece in the ecology of these mountains, and they have been missing for decades. Help to reintroduce this amazing animal into one of its native habitats, and one of the only places in the world where they can live in the wild.

Thank you for considering!

Correspondence: Bringing the grizzly bears back to the North Cascades is quite simply a logical choice. Scientific evidence presented by groups such as Friends of the North Cascades Grizzly Bear, Conservation Northwest, Woodland Park Zoo, Vital Ground, and others highlights the benefits that a grizzly bear population would have on the Cascade Ecosystem and the people of Washington. Restoring the grizzly bear population is a matter of doing what's right for Washington's wildlife and wilderness. Additionally, restoring the grizzlies is a matter of upholding the Endangered Species Act.

Grizzly bears (*Ursus arctos horribilis*) play several important roles in the maintenance of healthy ecosystems (Tardiff and Stanford 1998). In searching for and consuming food, grizzly bears facilitate several ecosystem processes, including spreading seeds and fertilizing plants through their scat, distributing nutrients between terrestrial and aquatic environments, and aerating soils through digging for bulbs and rodents (Tardiff and Stanford 1998). Without the presence of grizzly bears, the overall distribution and abundance of plant species within an ecosystem could completely change (Tardiff and Stanford 1998). With the absence of grizzly bears in Washington State, not enough is known about how nutrient cycling has changed, but many scientists hypothesize that Washington could be detrimental effects (Tardiff and Stanford 1998).

Grizzly bears are an umbrella species, meaning that protecting grizzly bear habitat also protects the biodiversity of all flora and fauna in their habitat (Roberge and Angelstam 2004). An umbrella species provides ecosystem services such as sustaining soil and plant health, supporting clean water production, and the maintenance of recreation areas (Sergio et al. 2008). Through the conservation of grizzly bears, all species within the same ecosystem will flourish.

Bringing grizzlies home to the NCE (the largest contiguous area of land that could support grizzlies left in the United States) would help preserve some of the most beautiful and wild places left in our country. An evaluation done by Almack et al. (1993) concluded the North Cascades Ecosystem had ample habitat to support a healthy population of grizzly bears. Sharing the mountains with grizzly bears creates a humbling experience from which all humans can benefit. Bears create respect for the land and nature itself. They highlight the most unforgiving aspects of life in the mountains and highlight the importance of environmental stewardship. Future generations of people and wildlife deserve the benefits of having the grizzlies back in the Cascades. I support Alternative C: incremental restoration.

Correspondence: I am a full time resident in Mazama WA and live and play in the Grizzly recovery zone. I'm writing in favor of the reintroduction of the Grizzly to the North Cascades. The primary reason for my support is my desire for allowing our environment to be truly wild and to return to its normal homeostasis. The Grizzly was an integral component to our landscape prior to being eliminated by humans. I believe there should be places in our country where humans don't dominate the landscape can be as it had been before humans altered it to suit their whims. I am not concerned about Grizzly/human interactions- there are many examples of areas where Grizzlies live where people live and recreate. I truly believe our experience in the wilderness would be enhanced by the presence of the Grizzly.

Let's do it!

Correspondence: We at Terra Advocati, oppose an experimental population designation in the North Continental Divide Eco-system and we oppose moving grizzlies to the North Cascades. We oppose the removal of individual bears to Washington state where they would lose their Endangered Species Act protections. Any plan to capture grizzlies and transport them would weaken the population in the NCDE. Grizzlies must be protected on both sides of the border. Under a natural recovery alternative, the FWS and the NPS would work with agencies in British Columbia to ensure bears are protected on both sides. Corridors would be identified toward that end. If the NPS does translocate bears within wilderness areas, it must comply with Wilderness Act regulations - no motorized equipment or helicopters and no invasive monitoring.

Thank you.

Correspondence: Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too.

Correspondence: I fully support the reintroduction of grizzly bears into the NCNP. The grizzly bear is a crucial part of the natural ecosystem that has sadly been nearly driven to extinction. We recently performed a huge project to transfer mountain goats from the Olympic Peninsula to the park to boost their numbers. If we did this because we truly value the diversity of the animals in the area, we should return the grizzly to their natural habitat. I have little concern about grizzly human interactions. This is managed well at many other places such as Glacier National Park or Yellowstone that receive far more visitors, and there are vanishingly few attacks. Most interactions will be people marveling the beautiful creatures from afar.

Correspondence: I write in support of the reintroduction of Grizzly Bears to the North Cascades Ecosystem via Alternative B (proposed action) under Section 10(j) of the Endangered Species Act.

Grizzly Bears have lived on this landscape for thousands of years, and are a culturally important species to many indigenous people. This should continue!

The North Cascades Ecosystem size and remoteness is suitable for Grizzly Bears, and it is one of only two Grizzly Bear areas without an established population of bears currently. Due to its extremely low numbers and relative distance and isolation from other healthier Grizzly Bear populations, it is not possible for them to repopulate the ecosystem through natural bear immigration. Additionally, the Grizzly Bear reintroduction benefits all other species and habitats.

There are few places left in the lower 48 states with habitat as secure, wild, and productive as the North Cascades. I really encourage the continuation of the reintroduction of Grizzlies to the North Cascades Ecosystem!

Correspondence: Thank you for this opportunity to comment on the NPS/USFWS preliminary proposal on how best to restore grizzly bears to the North Cascades Ecosystem (NCE). To do so is critical and has been languishing far too long in what should be done to correct human attempts to destroy ecosystems and all that call them home. I fully support grizzly bear recovery to the species' entire historical range.

I have a number of concerns about the plan.

Taking resident bears from the Northern Continental Divide Ecosystem (NCDE) and dropping them into a new ecosystem in a new geographic setting is very hard on the re-located bears and will also decrease the population in the NCDE. Your plan states that you will capture 3-7 grizzly bears a year in their current home ecosystem for 5-10 years, so this plan would move a total of 15-70 grizzly bears. It is estimated that there are approximately 1,000 bears (Vital Ground, 2022). That equates to removing 3-7% of a population that is not yet considered stable.

This would also subject bears to the stresses of capture, handling, transportation, and then being placed in a totally unfamiliar location. Transporting bears could also introduce mechanized equipment into federally designated wilderness, which is prohibited by the Wilderness Act. Ongoing use of helicopters to monitor relocated bears will equally disturb the bears being monitored as well as all other wildlife.

Further, the genetic diversity of the captured bears introduced to NCE will have to be guaranteed for the plan to work. This means that multiple bears may have to be captured to find one bear whose genetic code is diverse from bears already captured. This would spread capture stress across a much larger population.

There is no guarantee that relocation will be successful. As a result of studying bears in several bear management areas in Alberta, Canada (environments similar to that of the NCDE and possibly the same or similar bear populations that will be targeted for relocation), Stenhouse and colleagues (2022) found the following.

- Translocated bears move faster (km/hr), show greater daily displacement, and some showed less daytime activity than resident bears.
- Translocated bears spent 24% of their time in the poorest-quality habitat whereas resident bears spent 31% of their time in the highest-quality habitat
- Translocated bears revisited only 8% of locations from the previous year whereas resident bears revisited 32% of locations, representing an increase of 24% for resident bears.
- Within a year, 30% of translocated bear revisits were to the highest-quality habitat whereas 67% of resident bears revisits were to the highest-quality habitat, representing an increase of 37% for resident bears.
- Between years, 27% of translocated bear revisits were to the highest-quality habitat and only 46% were to the top-three habitat values. In contrast, 44% of resident bear revisits were to the highest-quality habitat and only 77% were to the top-three habitat values. This represents an increase of 17% to the highest-quality habitat and a 31% increase to the top-three highest-quality habitats for resident bears.
- Translocated bears spent 43% of their time in the highest mortality-risk habitats whereas resident bears spent 20% of their time in the highest mortality-risk habitats, representing a decrease of 23% for resident bears.
- Translocated bears spent 14% of their time within 100m of all anthropogenic features whereas resident bears spent 2% of their time within 100m of anthropogenic features, representing a decrease of 12% for resident bears.
- Within a year, 8% of translocated bear revisits were to the highest mortality-risk areas and 42% to the top three highest mortality-risk areas. 2% of resident bear revisits were to the highest mortality-risk areas and 19% to the top three highest mortality-risk areas. This represents a decrease for resident bear revisits by 6% to the highest mortality-risk areas and 23% to the top three highest mortality-risk areas.

Considering that the heart of the NCE is the national park, the potential for bear-human conflict is already great, and these

Using the results of this study, I draw a comparison between translocated bears and resident bears by applying the behavior to the bear in its home territory (resident) as compared to its behavior in its new territory (translocated). It is clear there is a measured and substantial decrease in habits that would support excellent health in the individual from its resident location to its translocated location.

This study indicates a proclivity on the part of translocated bears towards visiting and remaining in higher-risk, lower-quality areas. This introduces a health-decrease factor to bears who are relocated - a choice the bear did not make for themselves.

The goal of moving up to 70 bears with the goal of creating a stable population in the NCE of 25 bears indicate that the NPS and USFWS feel it is acceptable to have a mortality rate of 36% for the translocated bears. I point out that those very same bears would face a much, much lower mortality rate if they were left in their home territory. Grizzly bears are not sacrificial creatures.

Stenhouse and colleagues (2022) conclude as follows, which is an excellent summary of the problems with the current NPS-USFWS plan.

“In 1931, Dice suggested that the reaction of an animal to its environment is as equally important as are the characteristics of the environment in enabling the animal to survive (Dice 1931). Although there were no methods available at that time to investigate animal responses to novel environments, our findings support this important point and should be considered when translocating animals for management purposes. Because management agencies use wildlife translocation to address conservation conflict situations, or as a means to augment populations to support recovery or reintroduction actions, it is important to develop practices and protocols to monitor and evaluate the effectiveness of this technique. Regular review of outcomes would allow needed modifications in approaches to be incorporated into science-based best practices. It is important to understand the consequences of translocation for the animal (high levels of exploration over long periods) and how the animal may respond to novel environments (movements and habitat use). Furthermore, translocated bears will likely learn at different rates on the basis of individual behaviours and personality traits (Ordiz et al. 2014; Leclerc et al. 2016), past experiences (Morehouse and Boyce 2017) and individual temperaments (Réale et al. 2007; Armstrong et al. 2015), which was not possible to determine in the current study. The high levels of exploration shown by translocated grizzly bears in this study also suggest that wildlife management efforts focusing only on high-quality habitat to find the 'ideal' release site for translocations may need to be complemented with an understanding of exploration behaviour and movement (i.e., the bear may leave the high-quality habitat). In general, wildlife managers should translocate bears to places where there is both a high level of high-quality habitat (because bears are not initially good at finding high-quality habitat) and a land area where it is safe for them to range without reoffending (e.g., large natural areas).”

The relocated bears would be designated an experimental population under Rule 10(j), which means it can be considered either essential or nonessential. For a nonessential population, the regulatory burden associated with endangered species is relaxed regarding both hunting and requirements for consultation with partners (U.S. Fish and Wildlife Service, 2018). This loss of protections means that the relocated bears could be shot, re-captured, or killed in the NCE.

One of the reasons that grizzly bears have not re-established themselves naturally in the NCE is due to persecution, harassment, and loss of habitat. Mechanisms and direct action need to be taken to remove those conditions and thereby support the grizzly bear.

I propose that a better option would be to create wildlife corridors between NCDE and more western ecosystems that lie between NCDE and NCE. This is a slower process, but it is entirely a natural progression that will avoid traumatizing bears, helicopters in wilderness, and will maintain protections on bears to give them a fighting chance.

 Correspondence: Thank you for moving forward with the process of restoring grizzly bears to the North Cascades Ecosystem (NCE).

A healthy population of grizzly bears belongs in the NCE, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

The National Park Service and US Fish and Wildlife Service have an obligation to restore this federally listed species in the few places where that is possible. Failure to act would result in the permanent loss of grizzly bears from the park during our lifetime. Alternatively, the successful restoration will contribute to the overall health and wellbeing of the species across multiple landscapes.

Fortunately, Grizzly restoration has worked in other parts of the country and will work here too. Please act quickly and lean on the existing mountain of information your agencies have compiled to inform your final decision. The 2017 EIS outlined multiple viable strategies that were massively popular.

Please reconsider all the past public support and the time-tested strategies that will strike a balance to meet the mutual goals of grizzly bear recovery and people.

Correspondence: I am a resident of the NCE grizzly bear recovery zone who is firmly in support of grizzly bear restoration in my home range. I live in the Lower Twisp River watershed on property adjoining the Okanogan-Wenatchee National Forest. I grow a garden, have pets, feed birds, manage my wooded property, and spend time nearly everyday hiking, running, walking, or skiing through soon-to-again-be grizzly country. My lifestyle undoubtedly exposes me to potential interactions with grizzly bears -- and yet I would welcome them back in this ecosystem, and will gladly modify my own behavior to improve their chances of success.

As you prepare the EIS, I would ask you to consider the following:

(1) Will designation as a nonessential experimental population adequately protect the NCE grizzly bear? I understand the need for compromise, but I am concerned that this designation will allow for a "business as usual" situation. As I understand it, the population would, for all intents and purposes, not have its well-deserved ESA threatened status for purposes of private development or land management projects or for actions by the U.S. Forest Service. I understand the USFS would have to "confer" with the USFWS under Section 7, but given that USFS land accounts for the vast majority of the NCE, and given what I've seen of the USFS's version of "restoration" (early Mission Restoration Project implementation and one-size-fits all Twisp Restoration Project proposal), I'm not sure everyone is on the same page. I would like the USFWS to be able to apply binding terms and conditions to USFS actions rather than just grizzly-friendly suggestions. And, for instances where private projects have real potential to adversely affect grizzly bears, I would like to see actual ESA protections in place.

For the EIS, I ask that you conduct a detailed study of how a 10(j) designation is likely to affect the success of NCE grizzly recovery, as compared to full ESA protections throughout the recovery zone. Please disclose the number (or proportion) of grizzly bears likely to be taken each year as a result of the 10(j) designation. If the 10(j) designation remains part of the proposed action, please adjust planned translocation efforts to offset any foreseen losses of individual bears.

(2) Your FAQ document suggests that because people in the NCE already coexist with black bears, we are well on our way to conflict-free existence with grizzly bears. But I would beg to differ. For one thing, black bears and grizzly bears are not the same animal. The stakes are higher with grizzly bears, and people are understandably more afraid of them. At the same time, people are often loath to change their behavior for the benefit of wildlife -- and especially when the wildlife species in question is only around because of a controversial reintroduction effort. As it is, I'm not aware of any enforcement actions being taken locally against poor human behavior in black bear country. Nuisance black bear activity has been on the rise over the last couple years in the Methow Valley, evidently the result of berry crop failures and habitat loss from recent fires, but no doubt exacerbated by our collective reluctance to Be Bear Aware. Recently somebody on my road shot and killed a black bear that "walked past him to enter a carport where the garbage can was stored" (Methow Valley News, Sept. 28, 2022), and apparently went uncited. How do we transition from this sloppy state of affairs into having grizzly bears as neighbors? There need to be consequences NOW for our bad choices that result in black bears getting habituated or killed. I include myself in this because I am not perfect -- I still have considerable work to do to bear-proof my property, and that will be all the more imperative when grizzlies return.

For the EIS, I ask that you complete a detailed analysis of existing human-bear conflicts in the NCE and bolster the proposed action with interagency efforts to create a better baseline for grizzlies through bear-aware education, policy, and enforcement.

3) The proposed action takes an extremely cautious approach to grizzly bear recovery, with only a few bears introduced each year up to a starter population of 25, and a full target population of 200 not materializing for 60 to 100 years. It is difficult to say what humans will be doing in 60 to 100 years, but adaptive management of NCE grizzly bears could be quite low on the priority list. Grizzly bears are adaptable creatures with a good prognosis in the face of climate change. Their role in safeguarding biodiversity in the North Cascades may become increasingly important as other keystone species disappear. While it is still feasible (and remotely socially/politically acceptable) to complete costly NEPA analyses and fly around in helicopters translocating bears, I think we should

move more of them more quickly. I understand proceeding cautiously for the first 5 to 10 years while we retrain humans in the NCE, but after that, I say we shoot for carrying capacity as fast as possible.

The EIS should include a detailed study of the feasibility of grizzly bear recovery efforts as our own social, economic, and political systems become less secure. If the study finds reduced feasibility over time, alternatives that speed up the recovery process should be prioritized.

Am I looking forward to having grizzly bears back in the NCE? Intellectually and spiritually, yes! In terms of my day-to-day activities, not as much. After all, it will make more work for me, more vigilance while doing the things I love, and maybe even a hair-raising encounter or two. But with a well-executed restoration effort and a little cooperation from the NCE's resident humans, grizzly bears will be roaming Twisp River long after I've left, just as they did long before I arrived. And that's well worth it.

Correspondence: It's time for the average constituents of Washington to speak up about the protection and need for the Grizzly bears. We want them in the Cascades and the Pacific Northwest in general. We have enough mountain and land to be able to share their original land with them. It is what makes the Pacific Northwest a special area of the United States. I grow tired of the only input that is heard is cattle ranchers and hunters. Big money should not be able to buy or persuade what the majority of people want. It is ridiculous that we have to bag you for keeping our wildlife alive and thriving.  
Sincerely irritated,  
[REDACTED]

Correspondence: Hello!

As a yearly America the Beautiful pass holder and frequent NP visitor, I'd like to express my support for the reintroduction of Grizzly Bears to the Northern Cascades. Grizzlies are an important native keystone species and frankly deserve to have their native habitat back.

Thanks!

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.

Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.

Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.

Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence:	Wild things and wild places are central to the United States. After a long and troubled history of decimating, and in some cases extinguishing, various species of flora and fauna, we have learned that the existence of these natural wonders are beneficial to our psyches as well as our own survival through things like biodiversity and trophic cascade (as we have seen play out in Yellowstone National Park).

---

Grizzly bears lived in the North Cascades for thousands of years, and they belong here. We can live in a world that allows us to live side-by-side. Our lived experiences over the last couple of decades have provided a blueprint for bringing the grizzly back into its keystone role in the North Cascades environment.

Using the data and roadmaps in place, we need to return real wilderness to future generations that includes all

native species, including the grizzly. They are part of the US history, and the histories of the people native to the Americas before the establishment of the US.

There are only a few places left where grizzly bears can exist, and the North Cascades is one of them. Let's be part of making that happen.

Thank you.

Correspondence: Thank you for this opportunity to support grizzly bear restoration in the North Cascades.

I am a third generation Seattle area resident . I very much hope to see grizzly bears restored to this landscape. These magnificent bears have lived here for thousands of years, and deserve to continue to do so. They are integral aspects of local indigenous cultures, and inspire all of us to think beyond our own species. Grizzlies make important and essential contributions to local ecosystems by disseminating seeds and aerating alpine meadows. They are an endangered species that we must do all we can to support or we risk losing them forever.

Thank you,

Correspondence: Greetings National Park Service. Thank you for this opportunity to submit my comment re: reintroduction of grizzly bears into the North Cascades. Of course that is a good idea ! I'm fortunate to live along the 'scenic loop' which includes the North Cascades Hiwy and the beautiful Whidbey Island area. I strongly support conservation efforts for all wild animals including grizzlies. As well as any and all conservation efforts of original habitat and ecosystems. Once about 15 years ago, there was a 10 year building moratorium for the residential community where I reside. Once new builds commenced again, I watched as never-before-seen species of insects, variety of birds in great numbers, lots of snakes, butterflies, moths, ... slowly disappeared as habitat was replaced with housing. I feel fortunate to have witnessed a time where whenever I turned around a wild animal entertained and amused, and now slowly all but almost disappeared, like a slow movie....  
Wishing You Warm Holidays & Happy New Year. Sincerely, [REDACTED]

Correspondence: I'm writing regarding the Plan to Recover Grizzlies in North Cascades. •By kidnapping grizzlies from British Columbia or the Northern Continental Divide Ecosystem (NCDE) could disrupt and/or weaken the NCDE grizzly population. It could also diminish the needed population between the NCDE grizzlies and the ones in Yellowstone. Please oppose the capture of grizzlies from the NCDE. •The grizzlies that come from NCDE are currently protected under the Endangered Species Act (ESA). By moving the grizzlies from their home range and taken to Washington State, they will lose their protections under the ESA. The National Park Service (NPS) must come up with an alternative that will not rely on "experimental population" designation. Please oppose an "experimental population" designation. •The FWS and NPS must actively work with agencies in British Columbia to totally ensure the grizzlies are protected on both sides of the border. I can only see this as an alternative where the agencies would identify and protect corridors and connectivity so the grizzlies would move freely across the border without getting killed. Please analyze a natural recovery alternative that can work on both sides of the border. •The NPS and FWS must not pursue alternatives that would violate the Wilderness Act. If the NPS chooses to translocate the grizzlies, the agency should first consider limiting translocate within the Wilderness. The NPS must comply with the Wilderness Act: no helicopters, no motorized equipment and no invasive monitoring. •The best alternative is to meet a goal of a viable grizzly population in the North Cascades. Please allow and boldly promote the natural recovery of grizzlies.

Correspondence: Please reconsider your approach to grizzly bear recovery in the North Cascades.

As a hiker and backpacker in the North Cascades, I have a particular fondness for its Wilderness status. That is why your approach much be informed by the North Cascades' Wilderness designation. Your plan must:

1. Not capture grizzlies from the Northern Continental Divide Ecosystem. The plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades must not stand. Grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
2. Not have an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
3. Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
4. Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Thank you for the opportunity to comment.

Correspondence: It is always the RIGHT TIME to do the RIGHT THING! That time is NOW!  
My family and I, for generations, have enjoyed and supported the natural world in many ways, including fully utilizing our parks system. We travel in caravans in summer to insure that all the new grandkids can experience the same wild joy and wonder available to us all as Americans. Our nation, our diversity of both peoples and environments, are all a glorious gift that needs to be supported, defended, and preserved.  
The North American species ALL belong here - we have made great strides in learning to co-exist with the animals that evoke the greatest fear in us, because the truth is that they were here long before we were, and hold an inherent right to thrive here in their natural habitat. Are we really so fearful that we must destroy (or remove, relocate, whatever) all that makes us quake inside? We are better than that, I know we are.  
It is with great urgency that I respectfully request you engage in conversations leading to decisions that honor ALL of the natural species, for they are all connected and vital for ecological balance. Once again, the Grizzlies have come under fire - you have the unique opportunity in this shifting American landscape to draw the map, show us all how this can be done in an ecologically balanced way - show us all how we can co-exist, how both the wild species and the not-so-wild species (us) can forge a balance of existence, a win-win for the planet, for us all.  
Thanks for hearing me.

Correspondence: this is a difficult decision that you have to make. I appreciate your taking public comments.

I am commenting IN FAVOR of bringing grizzlies back to the North Cascades. your scientists now understand how the grizzly affects the earth's surface and I am strongly influenced by that priority. At this time in the earth's history, it seems imperative to do anything we can to preserve and protect the earth. Humans have alternatives other than meat for food sources, so while I sympathize with the ranchers I do not feel that ranch production and perpetuation outranks the need to protect the earth first.

Thank you..

Correspondence: Hi. Before being driven to the brink of extinction, grizzly bears were a native keystone species in the North Cascades and played an outsized role in keeping the ecosystem wild and in balance -- for example, their digging in alpine meadows aerates soils, disperses seeds, and facilitates plant growth. Without them, an essential part of the North Cascades is missing. In the Rocky Mountains, people have worked hard to save grizzly bears from extinction, and today people successfully live, work and recreate alongside grizzly bears. This can happen in the North Cascades, too. I strongly support reintroducing these stunning and essential animals back into their native land. Thanks for considering my thoughts.

Correspondence: I am writing to comment on the National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) plans to re-start translocating grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act. During this initial "scoping" period, the public has the opportunity to tell the agencies how to improve their tentative plan.

The proposed 6.1 million-acre recovery area includes North Cascades National Park and 2.6 million acres of Wilderness in the Pasayten, Mt. Baker, and Stephen Mather Wildernesses. Under the proposed action, the NPS and the FWS would capture bears from source populations in either interior British Columbia or the NCDE. Approximately 3 to 7 captured grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears.

The proposed action includes a problematic proposal to designate the reintroduced grizzly bears in the NCE as an "experimental population" under section 10(j) of the U.S. Endangered Species Act (ESA). Under this designation, the bears (at least any captured in the U.S.) would lose their current protections under the Endangered Species Act (ESA) and could be shot, re-captured, or killed in the North Cascades.

I support the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife. However suitable the habitat in the North Cascades is, we take issue with the methods likely to be used--the reintroduction plan could be extremely intrusive in designated Wilderness, could rely on activities prohibited by the Wilderness Act, and could come at a significant cost to Wilderness.

The plan's proposed helicopter landings would most likely occur either in Wilderness in North Cascades National Park or in Wilderness within the surrounding National Forests, despite most of the project area being outside of Wilderness. The extensive use of helicopters in Wilderness would continue indefinitely for monitoring bear movement and numbers, and would degrade the Wildernesses involved.

Heavy-handed management would not only be detrimental to Wilderness, but to bears as well, as they would be subjected to initial capture, handling, and helicopter flight, and attendant stress from such activities. Some may be injured or even die as a result. They would likely be collared, drugged, subject to samples taken, and handled for many years. And if that weren't enough, the proposed plan ignores the literature describing the effects of helicopters on wildlife, including grizzlies.

It's also questionable whether a translocation plan will be successful without Canadian support. Information is lacking on the status of grizzlies on the Canadian side of the border though this area is crucial in any success, as bears wander between the U.S. and British Columbia in the North Cascades ecosystem.

The essential irony is that agencies recognize the best place to release bears is in the exceedingly rare wildness of the North Cascades. The best grizzly habitat is synonymous with Wilderness: space to roam, isolation, denning sites, safety from human-caused mortality, and distance from human conflicts and garbage. But the agency's

proposed methods of re-establishing grizzlies diminish all these advantages.

If the Park Service adopts a translocation plan, it must be in line with the letter and spirit of the Wilderness Act. Monitoring should take place in a way that's respectful to Wilderness and bears, including using hair snags, camera traps, scat collection, and on-the-ground sightings to know whether the bears are thriving. It's wrong to rely on intrusive radio-collaring, helicopter landings, and ongoing sedating, capturing, and handling of the bears.

The proposed action lacks a natural recovery option. The best way to meet the goal of a viable grizzly population in the North Cascades would be to allow for and boldly promote the natural recovery of grizzlies. This is a very different approach than the "no action" option, which is to "do nothing." A natural recovery alternative would require working with British Columbia to protect grizzlies over a larger land base and would provide for connectivity between populations in the U.S. and Canada using protected habitat corridors. It would also include other measures to ensure that grizzlies are not killed by humans, regardless of what side of the border they are on and whether they are in National Parks, Wilderness, or other public or private lands. It might take longer and require more patience than the instant gratification of capturing and releasing dozens of bears, but it would ultimately create a more durable population sharing the landscape with a human population that is more likely to respect the bears that make it back to the North Cascades on their own.

Thank you for the opportunity to voice my concerns,

Correspondence: As a PNW local, avid backcountry traveler and supporter of wildlife conservation, I am writing to ask the National Park Service and Fish and Wildlife to reintroduce grizzly bears in the Cascades.

Grizzlies existed here long before human settlement drove them out. Being a native keystone species, they are important for the ecological balance of our wild lands. The North Cascades is one of the very few places remaining in the U.S. that can support grizzlies, and we should do our utmost to use that potential to help them prosper.

Thank you for your time,

Leavenworth, WA

Correspondence: Dear Project Managers,

Thanks for considering my comments. I live in Hamilton, Montana and I have been involved with grizzly bears and their recovery for quite some time. I served on the Grizzly Advisory Council in Montana and have commented on numerous projects in grizzly country and grizzly connectivity areas.

Grizzly bears are a keystone species that brings health and well-being to ecosystems. They aerate soils and spread seeds as they forage for food. They also keep ungulates on the move so streamside vegetation is protected and allowed to grow making streams healthy, free from sediment, and cooler.

While I welcome the idea of increasing the grizzly population in the Cascades, I think there are less harsh methods for augmenting the grizzly population in the Cascades. We know there are a few bears still living in the Cascades. There is photographic evidence of resident grizzly as recent as 2010. This program should be considered augmentation not reintroduction.

That said, augmentation results are slow and not always successful. While there has been some success in the Cabinets, it is minimal. An augmentation program should be coupled with a robust program to promote natural movement to the area through strong protections including limits on road construction and use, forest management, and recreation in key linkage zones and core habitat on public lands between Canada and the Cascades.

If you continue to call this "reintroduction" then the bears should not be considered an experimental 10(j) population. Instead they should be considered listed and protected by the Endangered Species Act (ESA). Experimental species status would confuse the issue since many bears already move in and out of the area from Canada. Those bears should continue to be protected, but would not be once they stepped into the Cascades. And essentially, agencies would be capturing protected grizzlies and sending them to an area where they could be killed. It makes little sense.

Better to leave protections in place for animals augmented and those who wander into the area naturally. Project should include a robust program of bear smart communities to reduce conflict. A strong program working with livestock producers to reduce conflicts through carcass pickup and electric fencing would also be required. These programs would be beneficial to any program supporting the recovery of grizzly bears in the Cascades.

An alternative should be analyzed that honors The Wilderness Act. No helicopters or any other mechanical or mechanized means should be employed for this project in Wilderness. The project calls for helicopter use in Wilderness over an indefinite period of time to monitor bear movement and population numbers.

The research work can all be done less intrusively, in the spirit of Wilderness, and with more consideration for bears. Monitoring can be done with hair snags, camera traps, scat collection, rub trees and ground sightings. Bears should not be continuously manhandled as planned in this project. Little information is available and no studies have been conducted on the effects of this intensive handling, drugging, collaring, and sampling, on the bears.

The plan proposes acquiring bears from the NCDE which is a recovering population. Taking breeding females from a population that is still recovering and still expanding is a robbing Peter to pay Paul scenario. If the bears cannot come from Canada, the project should instead rely on natural introduction and create protected linkage areas to ensure success.

There should be more information and more cooperation with Canada. It is lacking in this report. What is the status of bears on the Canadian side of the border from the Cascades? How can we create protected linkage areas and promote natural recovery in the Cascades? This information should be compiled and shared with the public.

I support the recovery of grizzly bears in the Cascades. I do not agree with the 10(j) status of these bears because grizzly bears are already utilizing the area and moving into the area from Canada. This program should be considered augmentation and protected status should follow the bears. This augmentation program should

include robust protections for linkage areas between the US and Canada and conflict mitigation programs in communities and with livestock producers.

Thanks for considering my comments.

Correspondence: Thank you for the opportunity to comment on this important topic. I am thrilled to have grizzly bears back in WA State. They are native to the state and play an important role in the ecosystem. The North Cascades provide a wonderful habitat for grizzlies with many very remote areas far from human development. Other communities in state's like Montana have learned to live with them and people here in WA State can learn to do that also.

Thanks again!

Correspondence: I STRONGLY SUPPORT THE IDEA OF RESTORING ECO SYSTEMS AND INTRODUCING GRIZZLY BEARS TO THE NORTH CASCADES IN WASH STATE, BUT WITH THIS RESERVATION.

THE WDFW MUST FIRST DEMONSTRATE BETTER POLICIES AND LAY MORE GROUND WORK AND EDUCATION WITH PREPARING THE PUBLIC FOR CO-EXISTANCE WITH PREDATORS IN GENERAL OR IT WILL BE UNFAIR TO ANY INTRODUCED GRIZZLIES TO BE PUT IN HOSTILE TERRITORY AMONG PEOPLE WHO HAVE NOT EVEN DONE WELL WITH LEARNING TO CO-EXIST WITH BLACK BEARS.

CURRENTLY, WASHINGTON STATE DOES NOT HAVE A GOOD TRACK RECORD OF CO-EXISTENCE, WITH BLACK BEARS WHICH ARE LESS THREATENING THAN GRIZZLES. ADEQUATE PREPARATION MUST COME BEFORE RE-INTRODUCTION.

Correspondence: Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.  
Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.  
Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.  
Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: I'm writing in support of establishing an experimental recovery population of grizzly bears in the North Cascades of Washington State. Establishing such a population would represent a significant milestone for North Cascades Ecosystem, from both a biological and sociological perspective. From the biological perspective, the North Cascades presents one of the few places in the US still capable of supporting these animals. Moreover, their reintroduction presents opportunities for building a richer set of ecological interactions. From the sociological perspective, reintroduction of grizzlies into our backyard does not come without thoughtful reflection on how these bears may impact our use of the wild lands surrounding us. And this is really my key message for land managers, and indeed for all of us with an "ownership" stake in public lands: I believe the presence of grizzlies in the North Cascades will likely encourage all of us to move through this landscape with a bit more humility and a keener sense of our responsibilities to the natural world.

Correspondence: Grizzly bears are currently protected in the NCE. DOI should work with Canadian counterparts to ensure safe migration corridors between Canada and the US.

This plan as proposed would force bears from another established area to be dropped into the NCE where survival is highly questionable. Severe restrictions on trail users is clearly going to be necessary, and even then, it is questionable whether decades of restricted access will matter to the population survival. The only reason DOI is now doing this is as a way to eliminate on-going litigation by groups that claim to help the bears but are really litigating for their own fundraising purposes. The bears are just being used. This plan doesn't help the bears, the communities, or the recreation users. It is a business decision promoted for good business.

Correspondence: I would like to comment on The National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS)

plan to translocate grizzly bears into the North Cascades Ecosystem (NCE) in Washington. While a new population of grizzlies in the North Cascades would restore this magnificent species to that ecosystem, the agencies' initial plan is misguided many ways.

The initial plan would most likely degrade Wilderness in the North Cascades, weaken the grizzly population in the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park, and strip the individual grizzlies of their current protections under the Endangered Species Act.

I support the recovery of grizzly bears and other native species where suitable habitat exists. The rugged North Cascades are historic grizzly bear habitat, and there may still be a few currently living on the U.S. side of the border, with a grizzly bear photographed there in 2010.

But recovery efforts must meet the requirements of the Wilderness Act. This means restoring the area's grizzly population without the use of motor vehicles, helicopters, and motorized equipment in Wilderness, without trammeling or manipulating Wilderness or its wildlife.

Please consider my comments:

- Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem. The federal agencies plan to kidnap bears from either British Columbia or the Northern Continental Divide Ecosystem (NCDE) around Glacier National Park to move to the North Cascades. But grizzlies have still not recovered in the NCDE, and there are no "extra" bears there to move to Washington. Such a plan would weaken the NCDE grizzly population and diminish the likelihood of developing the needed population linkages between the NCDE grizzlies and those elsewhere, such as in Yellowstone.
- Oppose an "experimental population" designation. The agencies must create and analyze an alternative that does not rely on the so-called "experimental" population designation. Under such a designation, individual bears from the NCDE--which are currently protected under the Endangered Species Act--would be taken from their home range and transported to Washington state, where they would lose their protections under the ESA.
- Analyze a natural recovery alternative. This is NOT the same as the No Action alternative. Under a natural recovery alternative, the FWS and NPS would actively work with agencies in British Columbia to ensure that grizzlies are protected on both sides of the border. Under this alternative, the agencies would identify and protect corridors and connectivity so that bears could move across the border without getting killed.
- Develop an alternative that doesn't violate the Wilderness Act. The agencies must not pursue alternatives that would violate the Wilderness Act and would entail heavy-handed, stressful management of bears. Should the NPS

choose to translocate bears, the agency should first consider limiting translocation to sites outside of Wilderness. If the NPS decides to translocate within Wilderness, it must comply with the Wilderness Act: no helicopters, no motorized equipment, and no invasive monitoring.

Correspondence: To Whom It May Concern,

The publication of the US Fish and Wildlife Service (USFWS) and the National Park Service's (NPS) commencement of another Environmental Impact Study (EIS) to validate their intent to reintroduce grizzly bears to the North Cascades Ecosystem (NCE) is surprising and disappointing. Given that the previous study spanned several years, at one can only imagine what cost, and was ultimately abandoned, to begin again shows a blatant disregard for the residents of Washington state and their opinions and values, as well as the tax dollars of every American who funds the National Park Service. This is yet another example of the USFWS and NPS jumping through the necessary hoops to pave a legal pathway for their own agenda, regardless of the feedback provided during that process.

The NPS claims that grizzly bears roamed the NCE for thousands of years, and that their absence creates an incomplete or out of balance ecosystem. The singular goal of reintroducing grizzly bears is clear. However, if the agencies involved are genuinely interested in an objective EIS, input from all scientific perspectives is required. The purpose should not be to validate an already established goal, but rather to explore the issue fully and determine the best course of action. Anyone can hand-pick a team of experts to prove a point on which all already agree. To selectively compile research backing one's own opinion takes no skill; to present that research to the public as the single and ultimate truth is manipulative. True objectivity comes from exploring all sides of an issue, especially the opposition, with an open mind and respect for all the evidence and opinions. The public wants to see the representation of the opposing perspective in the proposed agenda, and how its credible research and expert opinions are being utilized.

In conjunction with this point, the evidence that has been presented to validate the claim that grizzly bears have always existed in the NCE is subjective and weak. Finding stories, photographs, or even reported sightings as proof of the bears' presence in the NCE is not difficult. But none of that proves there was ever a self-supporting population relying on the NCE as their core. It is likely that the grizzly bear was firmly established along the coastal regions of Washington and only visited the interior lands on a seasonal basis or when populations expanded, such as a young boar being driven out. Oral history and unsubstantiated sightings are not proof. Few people are able to correctly identify different species of bears, especially at a distance or while experiencing stress related to being in close proximity to a bear. Historically, photographs provided dependable evidence, but in this modern age, even a photograph can no longer be assumed credible. Reliable, substantiated evidence has not been provided to uphold the claim that there was ever a self-supporting population of grizzly bears in the NCE.

The assumption that grizzly bears are an important and missing element in what would otherwise be considered a whole and healthy ecosystem is simplistic. What is the evidence that other bear populations are not filling that gap? Terms such as seed-spreading and aeration are used to justify the need, but is it really true that 45,000 black bears are not doing an adequate job of this? Is there actual proof of better aeration because a grizzly bear tears up the ground more than a black bear? Mass grazing accomplishes the same purpose, yet the NPS and USFWS issue citations for that, so clearly the need for aeration and seed-spreading is not the real issue. Further, the supposition that an ecosystem can be made whole and healthy through the introduction of a single species is laughable. Just as there is always an equal and opposite reaction in physics, there will be a multitude of unforeseen consequences and effects of adding grizzly bears to the NCE.

There is a difference in the natural selection of a species and the human-induced selection of a species. The synthetic introduction of a competing species on top of an established species is not natural selection. Further study is needed to determine the effect of the grizzly bear regarding food source competition, range interference, and perhaps most importantly, the behavior of the black bear. In other areas where these two species coexist, black bears are known to be significantly more aggressive and dangerous than in ecosystems without grizzly bears. Residents of these areas even deem black bears more dangerous than grizzlies. The possibility that introducing grizzly bears to the NCE will not just provide 200 aggressive bears for the public to contend with, but rather will create 45,200 aggressive bears, must be considered. A much broader study of the effects of the grizzly bear on competing species, including other bears, wolves, coyotes, wolverines, and even fishers, is needed before changes are made.

The idea that the introduction of grizzly bears into the NCE will somehow repatriate Native American tribes with a part of their culture that was destroyed at the hands of white intruders makes several assumptions. Firstly, it assumes that the grizzly was a part of the culture of inland tribes. Where is the evidence substantiating this claim? Secondly, it assumes that it was white men who are responsible for the bears' purported disappearance. Where is the evidence substantiating this claim? Thirdly, it assumes that grizzly bears were regarded as a blessing by the Native American people. To be sure, contending with bears was a part of Native American lifestyle. But to assert that grizzly bears were undoubtedly a blessing in Native American culture is a gross assumption and potentially mocks the intelligence of the Native American people. Since when is a bear hide a fur? Why would we assume that native Americans, obtaining better weapons, wouldn't also work to eliminate a malicious and dangerous population of bears? As stated, where is the evidence substantiating your unbalanced and perhaps racist claims? The premise that the NPS has standing to be a lead agency in the introduction of grizzly bears to the NCE is questionable. Historically, the NPS was the agency responsible and better known for helping the public access and enjoy the wild heritage of this country through "the preservation, from injury or spoliation, of all timber, mineral deposits, natural curiosities, or wonders within said park, and their retention in their natural condition." (NPS Website, Origin of the National Park Idea, March 10, 2016) How does the introduction of grizzly bears support this responsibility and increase the "benefit and enjoyment of the people"? (same reference) Make noise. Wear bells. Whistle. Carry bear spray. Travel in groups. Put an electric fence around your camp. Do not camp while you are menstruating. Is that how the great wilderness should be explored and experienced? Additionally, the NPS holds only a minor part of the greater ecosystem alleged to have been occupied by grizzly bears, the North Cascades National Park (NCNP). As the NCNP is held under Proprietary Jurisdiction rather than Exclusive or Concurrent Jurisdiction, and as the state of Washington has current legislation prohibiting the introduction of grizzly bears into the state, to claim the NPS as a lead agency is inappropriate, egotistical, and grossly overestimates their role in the entire issue. (RCW 77.12.037) Furthermore it grossly underestimates the area and the range that the imported grizzlies will end up in.

Protection of the community is one of the responsibilities required of the NPS, per Public Law 90-544. Time and time again, the agencies have, while seeking to placate residents, conducted public meetings held to convince residents that further preservation of natural areas will be a boon to communities. Industries like timber harvesting and grazing are to be substituted with tourism and a flourishing economy is the inevitable result. This is the case in Stehekin, although our economy has mostly been built upon tourism from the start. Now you insist on an action that will in fact jeopardize tourism and spend millions of dollars that would be better spent improving habitat and rebuilding a shamefully shabby infrastructure that does, or could, enhance the true visitor experience. Are these promises accurate with regard to the proposal to introduce grizzly bears? The idea that the presence of grizzly bears will increase the wilderness experience is pure fallacy. As an outfitter and a guide, I have seen firsthand how bear encounters negatively affect the average NCNP visitor. Bear encounters may sound romantic to the uninitiated or even benign to the experienced, but to the visitor, they are truly terrifying, and enough so to prevent people from visiting areas where bears are known to be. The idea that simply educating people to this pro-grizzly bear perspective will result in everyone seeing the benefits and agreeing with the proposed agenda is insulting. Why do residents of areas populated by grizzly bears keep firearms close and prefer to sleep in trailers or in houses instead of tents? Because they respect the bears potential and value their lives and their property. No sourdough or trapper in Alaska leaves behind a tent with their stores and has any hope of coming back and finding it not ravaged. The same can be said for black bears when a camp is left unattended, but currently human occupation is a strong deterrent. To suggest that an academically educated individual who has no experience living in bear country is qualified to educate anyone on how to safely coexist with grizzly bears being introduced to the area against the will of the residents is ludicrous. This is not about educating me; this is about changing my

entire culture.

If it is going to be conducted at all, this EIS needs to be conducted objectively. I challenge the biased research and evidence presented by USFWS and the NPS. I challenge the science and proof that black bears and other species are not meeting the needs of the ecosystem. I contend that a broad, unbiased study of the effects of competing species and the specific effects of grizzly bear populations on black bear behavior is critical. I challenge whether this plan legitimately restores any major part of Native American culture. I challenge the NPS standing and jurisdiction in this matter and I challenge whether the area of land under your quasi-control is even a significant sampling of what the true range of the grizzly could end up. At the minimum this EIS should encompass all of Washington and part of Oregon, California, Idaho and British Columbia.

There are far more productive and necessary applications for the time and resources of the USFWS and NPS. Please direct your resources to appropriate care and maintenance of what you currently oversee. The changes and benefits therein are inevitable.

Sincerely,

---

Correspondence: I don't know how this is even up for debate. The U.S Fish and Wildlife Service said in their own recovery plan for grizzlies we need a population established in the North Cascades and decades later we still haven't in what is the best habitat for grizzlies in the country. For those that are arguing that they can't coexist with grizzlies, I did for over a decade in the Greater Yellowstone in Montana. Most grizzlies you are not going to have problems with, most leave people alone, and when you do have bear human conflicts then go out there and educate the public, figure out the problem is, and at times I don't deny you will have to put down bears that get into conflict. I understand that. But grizzlies are already in Washington, have not recovered in the state, the best available science from COUNTLESS scientific studies show the North Cascades can support grizzlies. This isn't up for discussion debate and with Montana who has a state legislature and I would know given I lived there my entire life until 2022, you should be getting grizzlies out of that state if nothing else. The politicians in Montana won't stay out of wildlife management and I'm terrified we could be send decades back of recovery if they get delisted in the state. Put them under 10J, do whatever you need to do to get them here but bringing them to the North Cascades has been long overdue. Bring the grizzlies there already for gosh sakes.

Correspondence: To whom this concerns,

North Cascades National Park and surrounding wilderness areas are a very special place to me, as I thoroughly enjoy it's incredible wonders. Restoring grizzly bear populations to this area would right a wrong by bringing these magnificent animals back into their natural habitat. They should also be restored for the following reasons:

\* Grizzly bears have lived on this landscape for thousands of years and deserve to be here.

- Grizzly bears are culturally important to tribal people and Washingtonians who have lived here for generations.
- Grizzly bears are an endangered species that we must actively recover or risk losing.
- I want to pass down a wild landscape that includes all native species, including the grizzly.
- Grizzly bears provide an ecosystem service, spreading seeds and aerating alpine meadows.
- There are few places left in the U.S. where grizzly bears can exist. The North Cascades ecosystem is one

of those few protected places.

- I hope to see a grizzly bear in the North Cascades one day.

Thank you for your consideration.

Sincerely,

[REDACTED]

Correspondence: I taught science to learners in grades K-6, encouraging them to observe, record, question, research. My research shows that bears are not just an icon, they are a keystone species.

Living in Washington all my life, I've X-C skied for years in the Methow, driven over Washington Pass with my kids, with soccer teams, with friends AND

advocated for keystone species at the top of the chain, like grizzlies. We're bringing lynx back in Central and NE Washington; we're managing mountain goats in Olympic Natl Park and North Cascades;we're trying to keep wolf packs viable in the same area: the grizzlies belong too.

Historically they've been in central Washington. Because Washington Pass closes often in late September, as in 2022, they'd have a longer protected time to den and mother their cubs.

Please design and support the reintroduction of grizzlies to North Cascades & central Washington. Thank-you!

Correspondence: Since historically the North Cascades have had grizzly bears, I would like to express my support for the NPS reintroducing them. Reintroducing an apex predator may well start a trophic cascade in the vein of Yellowstone, a well-documented success story. Especially with the declines in biodiversity and habitat across the nation, and the world, this would be an action that may well help mitigate the challenges that we face in the decades to come.

Correspondence: I am writing in regards to reintroducing grizzlies to the North Cascades. As someone involved in environmentalism, wildlife and nature is an extremely important focus for me. And as we unfortunately witness the rapid decline of hundreds of species, it is essential that grizzly bears are not only given the chance to thrive, but to also receive the protection of humans. And hopefully, that protection can come from the National Park Service.

For thousands of years, grizzlies lived in the North Cascades, and it is through human activity and habitat loss that they are not there anymore. As a native keystone species, they are vital to the ecosystem there. Furthermore, grizzlies are culturally important to many Native American tribes and First Nations peoples. They belong in the North Cascades, and we should be able to have a future where grizzlies are not only back in their native country, but also able to peacefully coexist with humans. People already work alongside grizzlies in Yellowstone and the northern Rocky Mountains, so there should be no reason why the same can't apply to the North Cascades. There already few places in the world where grizzlies can live. Let's make the North Cascades accessible to them again.

Thank you for your time and consideration.

Superintendent Don Striker  
North Cascades National Park Service Complex  
810 State Route 20  
Sedro Woolley, WA 98284

RE: Scoping Comments on the federal plan to prepare a North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement

Dear Superintendent Striker

I write in support of the U.S. Fish and Wildlife Service (FWS) and National Park Services' (NPS) efforts to restore and maintain a healthy Grizzly Bear population in the North Cascades Ecosystem (NCE). The following scoping comments are provided to help shape the draft environmental impact statement (EIS).

As a former park ranger who worked at the North Cascades, Yellowstone, and Glacier National Parks I have had significant experience working, living, and recreating in Grizzly country. I've had countless encounters with Grizzly bears during my time in these and other parks, and every encounter left me exhilarated and grateful that my country is big enough to set aside some truly wild places for Grizzlies to live.

During my time as a ranger, I met tens of thousands of visitors from all over the world. Nearly everyone came to these parks with the hope of seeing a bear in general and a Grizzly bear in particular. It was my experience, that those who did see a Grizzly realized it was likely a once-in-a-lifetime experience, something they would cherish.

The FWS and NPS have a unique occasion to increase the chance present and future generations can also have this "once in a lifetime experience" by insuring there is a viable Grizzly bear population in the NCE at the soonest time practicable.

As the background scoping material rightly point out, the FWS and NPS are required by both federal statute and case law to leave the North Cascades Complex and surrounding federal lands and wilderness protected and unimpaired for future generations. The FWS and NPS when considering the reintroduction of the Grizzly bear must under the National Environmental Policy Act conduct a thorough analysis.

To those ends, the EIS's stated purposes are to:

- Avoid the permanent loss of Grizzly bears in the NCE,
- Contribute to the restoration of biodiversity,
- Enhance the probability of long-term survival of Grizzly bears in the NCE, and
- Support the recovery of the Grizzly bear to the point where it can be removed from the endangered species list.

These are all worthy goals. The FWS and NPS should also add to the EIS' list of purposes the following:

- Reintroduce individual Grizzly bears to the NCE to augment the current non-viable population
- Comply with federal law such as the Organic Act which requires the NPS to leave parks resources and wildlife habitat unimpaired for future generations.

The FWS and NPS propose two alternatives (a no-action and proposed alternative) for Grizzly recovery. The proposed alternative as compared to the no-action alternative would produce maximum benefits to the NCE, including the restoration of an apex predator while minimizing long-term costs. The proposed alternative also best complies with federal statutes, policy, and case law.

The background material the FWS and NPS provided on this proposal states that historical records indicate that Grizzly bears once "occurred throughout the NCE." Later on, the agencies note that Grizzly bears in the NCE are at risk of local extinction. Extinction as defined by the encyclopedia Britannica is "the dying out or termination of a species. Extinction occurs when species are diminished because of environmental forces (habitat fragmentation, global change, overexploitation of species for human use) or because of evolutionary changes in their members (genetic inbreeding, poor reproduction, decline in population numbers)." Extinction can take place at many levels including the loss of local populations and scientific studies on the removal of apex predators are finding this extinction represents a lasting injury or impairment to that ecosystem. Further, the extirpation of Grizzly bears from the NCE represents a violation of the Endangered Species Act's prohibition of the extinction of listed species, the NPS Organic Act's requirements that park resources and wildlife be left unimpaired and for the enjoyment of both present and future generations, the Wilderness Act's requirement that wilderness areas be managed to preserve natural conditions and appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable, as well as the National Environmental Policy Act's requirement that federal agencies prepare detailed statements assessing the environmental impact of and alternatives to major federal actions significantly affecting the environment.

#### ESA Mandates

As stated above, federal law such as the Endangered Species Act requires federal agencies such as the FWS, NPS, and the United States Forest Service (USFS) to prevent the extinction of federally listed species. Since 1975 the Grizzly Bear has been listed as threatened in the continental United States. Previous NPS Grizzly bear documents state that currently it's highly unlikely the NCE contains a viable Grizzly bear population. It's believed the four documented Grizzly bear sightings in the NCE are the result of 2 bears. Two bears are not a viable population,

which by definition means the NCE Grizzly bear faces near-term extinction.

NPS management policies also require proactive action on preventing local extinction. Specifically, the 2006 policies states it is NPS policy to "pass on to future generations natural, cultural and physical resources that meet desired conditions better than they do today, along with improved opportunities for enjoyment." Emphasis added.

The no-action alternative doesn't comply with federal law and policies which require the FWS and NPS to take immediate action to prevent extinction. A modified preferred alternative which actively and expeditiously reintroduces individual Grizzly bears to the NCE best complies with these requirements.

#### Organic Act Mandates

Next, the recovery time frames as stated in the background materials are far too long and likely make them illegal.

The Organic Act requires the NPS to leave park resources unimpaired for the enjoyment of both present and future generations. The FWS and NPS' know the enjoyment mandate that is contemplated is this statute:

"Is broad; it is the enjoyment of all the people of the United States and includes enjoyment both by people who visit parks and by those who appreciate them from afar. It also includes deriving benefit (including scientific knowledge) and inspiration from parks, as well as other forms of enjoyment and inspiration. Congress, recognizing that the enjoyment by future generations of the national parks can be ensured only if the superb quality of park resources and values is left unimpaired, has provided that when there is a conflict between conserving resources and values and providing for the enjoyment of them, conservation is to be predominant. This is how courts have consistently interpreted the Organic Act."

At a minimum, the FWS and NPS estimate it will take between 60 to 100 years, if not longer, for the preferred alternative to reach 200 bears. These timeframes prevent present generations from enjoying a recovered Grizzly bear population whether through direct visits, from afar, or through scientific research and inspiration. They also prevent a significant portion of future generations from enjoying these bears. This is a violation of the Organic Act's mandate that parks be provided for present-day and future enjoyment. As such, the draft EIS should include an alternative with an expedited recovery timeline.

#### Wilderness Act Mandates

The 1964 Wilderness Act requires federal agencies to manage designated wilderness as "an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain." This mandate includes the restoration of a wilderness area's "wilderness character." The Forest Service in an interagency report defines wilderness character to include an area that is untrammelled, undeveloped, natural, and provides an opportunity for solitude or primitive and unconfined recreation. The Forest Service notes that wilderness character is degraded by many things including the "Extirpation or extinction of native animals and plants." The Forest Service also understands that Congress has made clear that preserving wilderness character is the act's primary legal mandate.

According to the Natural Resource Conservation Service, Grizzly bears once ranged from the Arctic Slope to Central Mexico and from the Pacific Coast to Minnesota. Today, "the grizzly mainly occupies high mountain wilderness areas."

Federal law and policy require agencies like the FWS, NPS, and the USFS to protect not just wilderness but its wilderness character. Grizzly bears according to the federal government are mainly associated today with high mountain wilderness areas like the North Cascades. By its admission, the federal government recognizes the extirpation of a native wilderness species is a degradation of wilderness barred by federal law. As stated above, the EIS's no action alternative is unlikely to save the bear from local extinction and therefore does not comply with the Wilderness Act. The proposed action on the other hand, better complies with this act, by returning Grizzly Bears to a stable population in the shortest time possible, and thus better restoring the wilderness character of the NCE also at the shortest time possible.

## NEPA Mandates

The National Environmental Policy Act requires federal agencies to assess the environmental effects of their proposed actions before making decisions. Agencies are required to assess and consider all reasonable impacts on the affected environment.

The FWS and NPS ask the public when providing comments to consider the following questions:

- What other alternatives, alternative elements, or management tools should be considered?
- What issues should be considered when evaluating the restoration of grizzly bears in the NCE?
- What do you like and dislike about the preliminary alternative concepts, and why?

The following are provided in response to these questions.

1. The EIS should investigate Grizzly bear extirpation and its impact upon the NCE. The removal of large predators such as the Gray Wolf and its impact on the environment have been studied at national parks like Olympic and Yellowstone. A similar analysis of the impacts of Grizzly bear extinction in the NCE should be conducted in this EIS before making a decision.
2. The EIS should also include an alternative that does not designate the Grizzly bear population as a section 10(j) Endangered Species Act experimental population. A 10(j) designation appears to place more emphasis on satisfying the concerns of a small number of private interests and landowners at the expense of the larger public. An alternative that does not include the experimental designation would provide the public with the information necessary to compare the impact a 10(j) designation has on the overall efficiency, effectiveness, and timeliness of NCE grizzly bear recovery.
3. The EIS should also provide a balanced review of Grizzly bear recovery on public safety. Grizzly bear populations have dramatically increased over the past half-century at Yellowstone and Glacier from a few isolated bears to healthy populations of hundreds today. Over these parks' more than 100-year histories less than a dozen visitors respectively have been killed by Grizzly bears. One is just about as likely to be killed by lightning in these parks as a Grizzly bear. Visitors are far more likely to die from drowning, heart attacks, or falls. These trends would likely be similar at NCE.
4. The FWS and NPS should also take care not to overstate in its EIS the potential impact the reintroduction of Grizzly bears to the NCE will have on private livestock. In previous Grizzly bear recovery materials, the FWS and NPS state "concerns have been raised about the potential for depredation of livestock." Concerns have been raised about the potential for [Grizzly bear] depredation of livestock. While this is a possibility, it is very remote. Grizzly bears have been known to kill livestock such as cattle and sheep, but through good livestock management such as the elimination of bone yards and active herd monitoring livestock deaths can be reduced. Researchers have found bears tend to prey on livestock because it tends to represent an easy foraging opportunity. However, these impacts will be less in the NCE because the area already contains excellent Grizzly bear habitat with outstanding non-livestock foraging opportunities. Moreover, the scope of the threat will be smaller in NCE. The FWS and NPS estimate that there are more than 220,000 heads of cattle in the region of influence. By comparison, the Greater Yellowstone Ecosystem (MT, ID, WY) has at least double this many heads of cattle. Moreover, there are few firm numbers on the number of cattle killed by grizzlies but it's likely around 30 to 40 per year. With both fewer cattle and bears than the GYE, the NCE is likely to see far fewer Grizzly cattle predations.
5. The FWS and NPS have set 200 bears as the target population. However, counting Grizzly bears is not straightforward. Researchers out of Yellowstone report that coming to a Grizzly bear population estimate is not simple. The FWS and NPS should accurately estimate in the EIS the time, energy, and resources needed to accurately count NCE bears. Without a better explanation of how the FWS and NPS plan to count NCE bears, public confidence in any Grizzly bear population numbers will be questionable at best.

6. Finally, the FWS and NPS must incorporate the impact climate change will have upon the agencies' grizzly bear recovery goals including its primary goal of avoiding the permanent loss of Grizzly bears in the NCE. Climate change and its impacts on the NCE will have a significant impact on the federal government's ability to achieve its stated purposes. In addition, the agencies should consider an alternative that includes an accelerated recovery timeframe. Climate change and its impact on NCE's habitat for example may require recovery to be completed before the proposed timeline.

I appreciate both the Fish and Wildlife Service and the National Park Service's efforts to recover the NCE's Grizzly bear populations. I encourage the FWS and NPS to incorporate these scoping comments into the draft EIS.

Sincerely,

Correspondence:	I am writing to express my wholehearted support for the possible restoration of the grizzly bear population in the North Cascades. Please re-initiate the process of returning the bears to that area.

The North Cascades provide a good area for the success of this project. The large, remote habitat it offers would give grizzlies a place to thrive. Unfortunately, to get them back to a thriving population requires human intervention. After being wiped out by hunting and trapping, the population has not been able to restore itself through the normal process of immigration and reproduction. That is a major reason why I think you should help the process get started.

Furthermore, it is important to me to see grizzlies restored to the area. As a Washingtonian, I have cheered efforts to restore populations of fishers and lynx in the state. Such efforts help strengthen ecosystems while giving struggling species around the country a boost. Washington feels like a better place each time one of these species

comes back.

Finally, grizzlies can help improve the ecosystem in the North Cascades. As a native species, the grizzly can help strengthen the ecological balance in the area.

I hope you will re-initiate the process of returning grizzlies to the North Cascades.

Thank you for your time.

Superintendent Don Striker  
North Cascades National Park Service Complex  
810 State Route 20  
Sedro-Woolley, WA 98284

Re: Scoping comments for the 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan and Environmental Impact Statement

(Comment submitted via the National Park Service Planning, Environment & Public Comment website (PEPC).)

Dear Superintendent Striker:

I am writing on behalf of Skagit Audubon Society to provide comments during the scoping phase of the North Cascades Ecosystem Grizzly Bear Restoration Plan and Environmental Impact Statement.

Skagit Audubon is the Skagit County-centered chapter of National Audubon, with 448 members living in Skagit and adjacent counties. We share the Audubon mission to conserve and restore natural ecosystems, focusing on birds, other wildlife, and their habitats for the benefit of humanity and the earth's biological diversity.

Consistent with the Audubon mission, we support the decision made thirty-one years ago to restore grizzlies to the North Cascades when the Interagency Grizzly Bear Committee designated the North Cascades a grizzly bear

recovery area. The 1975 listing of the species under the Endangered Species Act established a legal requirement that this species be restored, and the large, mostly publicly owned and protected area of the North Cascades Ecosystem provides an appropriate place to do that. Just as we have supported the restoration of the fisher to this ecosystem, we want the grizzly bear to once again fill the ecological role it played here for thousands of years. We realize that taking this stance, though entirely consistent with Skagit Audubon's mission, is not without controversy, perhaps even with some of our members. We are depending on a carefully and thoroughly prepared restoration plan and environmental impact statement (EIS) to help alleviate potential concerns.

#### Evaluating and improving safety-related measures and programs:

The National Park Service and other land managing agencies in the North Cascades Ecosystem along with partner organizations have done a very large amount of good work over many years educating the public on how to camp and hike safely in bear country. Black bears are numerous in the Cascades, and equipping campgrounds with bear-resistant trash containers, consistently posting bear-related safety information at trailheads, and many other measures have prepared us for the day when grizzly bears once again inhabit the Cascades. We hope that the restoration plan and EIS will review and evaluate these measures and programs and include ideas for continuing to improve them to further ensure the safety of people visiting habitat where both bear species are present.

We offer the following scoping comments.

#### Taking climate change into consideration:
